

## SALMAN AHMAD SIDDIQUI

Focus on Concepts(leave no single doubt), terminologies and try to understand problem statements.. If you successfully done these three things you can solve any problem that is based on that concepts.

Mathematics is a concept based subject and if you know the true meaning of "CONCEPT" and start working on it, then you will become self sufficient as for as Mathematics is concerned.

Mathematics problems are like an instruction manual, if know how to read it and how to follow it you will never astray.

Most of the time student fail to solve a mathematics problem , because they do not understand the exact meaning of terminologies in problem statement or assume something which is not explicitly stated in the problem statement or ignore one or many possibilities.
