Natural Numbers (N)

↳ counting numbers

$$N = \{1, 2, 3, 4, 5, \dots, \infty\}$$

↑ infinity

Whole numbers (W)

$$W = \{0, 1, 2, 3, 4, 5, \dots, \infty\}$$

* All 'N' are 'W'

* But all 'W' are not 'N'

Integers (I or Z)

* All natural numbers (N) are integers.

* All whole numbers (W) are integers

Factors

It is a number which divides the given no. completely.

$$1 \longrightarrow 1$$

$$2 \longrightarrow 1, 2$$

$$3 \longrightarrow 1, 3$$

$$4 \longrightarrow 1, 2, 4$$

$$5 \longrightarrow 1, 5$$

$$6 \longrightarrow 1, 2, 3, 6$$

$$7 \longrightarrow 1, 7$$

$$8 \longrightarrow 1, 2, 4, 8$$

$$9 \longrightarrow 1, 3, 9$$

$$\begin{array}{r} 1 \overline{) 1} \\ \underline{1} \\ 0 \end{array}$$

$$\begin{array}{r} \sqrt{1} \overline{) 2} \\ \underline{2} \\ 0 \end{array}$$

$$\begin{array}{r} \sqrt{2} \overline{) 2} \\ \underline{2} \\ 0 \end{array}$$

for any given number, 1 & the number itself is always a factor.

Factors

It is a number which divides the given no. completely.

$$1 \longrightarrow 1$$

$$2 \longrightarrow 1, 2$$

$$3 \longrightarrow 1, 3$$

$$4 \longrightarrow 1, 2, 4$$

$$5 \longrightarrow 1, 5$$

$$6 \longrightarrow 1, 2, 3, 6$$

$$7 \longrightarrow 1, 7$$

$$8 \longrightarrow 1, 2, 4, 8$$

$$9 \longrightarrow 1, 3, 9$$

Prime no.

A number which has exactly two factors

Eg: 2, 3, 5, 7, etc.

Composite no.

A number which has more than two factors.

Eg: 4, 6, 8, 9, etc.

- * 1 is neither prime nor composite
- * 2 is the smallest prime number.
- * 4 is the smallest composite number.

Multiples

2 \longrightarrow 2, 4, 6, 8, 10, 12, 14, - - - - -

4 \longrightarrow 4, 8, 12, 16, 20, 24, 28, - - - - -

HCF (Highest Common Factor)

6 → 1, 2, 3, 6

12 → 1, 2, 3, 4, 6, 12

$$\text{HCF}(6, 12) = 6$$

HCF is the largest number which divides the given no.

9 → 1, 3, 9

18 → 1, 2, 3, 6, 9, 18

$\text{HCF}(9, 18) = 9$
9 is the largest no. which divides 9 & 18

LCM (Least Common Multiples)

2 → 2, 4, 6, 8, 10, 12, 14, 16, 18, ...

3 → 3, 6, 9, 12, 15, 18, 21, 24, ...

$$\underline{\text{LCM}(2, 3) = 6}$$

LCM is the smallest number which is divisible by the given no. (2 & 3)

LCM (5,6)

5 \longrightarrow 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, ...

6 \longleftarrow 6, 12, 18, 24, 30, 36, 42, 48, 54, 60, 66, 72, ...

$$\underline{\text{LCM}(5,6) = 30}$$

30, which is the LCM is the smallest no. which is divisible by the given no. (5 & 6)

Fundamental Theorem of Arithmetic :

Every composite number can be expressed (factorised) as a product of primes, and this factorisation is unique, apart from the order in which the prime factors occur

~~2~~, 3, 5, 7, 11, 13, _ _ _ _

$$18 = 2 \times 3 \times 3 = 2^1 \times 3^2$$

$$18 = 3 \times 2 \times 3 = 2^1 \times 3^2$$

$$18 = 3 \times 3 \times 2 = 2^1 \times 3^2$$

$$\begin{array}{r} 3 \overline{)18} \\ 3 \overline{)6} \\ 2 \overline{)2} \\ 1 \end{array}$$

$$\begin{array}{r} 2 \overline{)18} \\ 3 \overline{)9} \\ 3 \overline{)3} \\ 1 \end{array}$$

$$\begin{array}{r} 3 \overline{)18} \\ 2 \overline{)6} \\ 3 \overline{)3} \\ 1 \end{array}$$

$$7 \times 7 \times 7 \times 7 = 7^4$$

↑ power
↑
base

Find the LCM and HCF of 6 and 20 by the prime factorisation method.

$$6 = 2^1 \times 3^1$$

$$20 = 2^2 \times 5^1$$

$$\text{HCF}(6, 20) = 2^1 = 2$$

$$\text{LCM}(6, 20) = 2^2 \times 3^1 \times 5^1 = 4 \times 3 \times 5 = 60$$

$$\text{HCF}(6, 20) \times \text{LCM}(6, 20) = 6 \times 20$$

$$2 \times 60 = 120$$

$$120 = 120$$

$$\text{HCF}(a, b) \times \text{LCM}(a, b) = a \times b$$

$$\begin{array}{r} 2 \overline{)6} \\ 3 \overline{)3} \\ 1 \end{array}$$

$$\begin{array}{r} 2 \overline{)20} \\ 2 \overline{)10} \\ 5 \overline{)5} \\ 1 \end{array}$$

The HCF and LCM of 12, 21 and 15 respectively are

(a) 3,140

(b) 12,420

✓ (c) 3,420

(d) 420,3

$$\begin{aligned}12 &= 2^2 \times 3^1 \times 5^1 \\21 &= 3^1 \times 7^1 \times 5^1 \\15 &= 3^1 \times 5^1\end{aligned}$$

$$\begin{array}{r}2 \overline{)12} \\ \underline{2} \\ 6 \\ \underline{2} \\ 3 \\ \underline{3} \\ 0\end{array} \quad \begin{array}{r}3 \overline{)21} \\ \underline{3} \\ 7 \\ \underline{7} \\ 0\end{array} \quad \begin{array}{r}3 \overline{)15} \\ \underline{3} \\ 5 \\ \underline{5} \\ 0\end{array}$$

$$\text{HCF}(12, 21, 15) = 3^1 = 3$$

$$\text{LCM}(12, 21, 15) = 2^2 \times 3^1 \times 5^1 \times 7^1 = 4 \times 3 \times 5 \times 7 = 420$$

HCF = Product of the smallest power of each common prime factor in the numbers.

LCM = Product of the greatest power of each prime factor, involved in the numbers

The total number of factors of a prime number is

(a) 1

(b) 0

 (c) 2

(d) 3

10

4

The LCM of smallest two digit composite number and smallest composite number is

- (a) 12
- (b) 4
- (c) 20
- (d) 44

$$10 = 2^1 \times 5^1$$

$$4 = 2^2$$

$$\text{LCM}(10, 4) = 2^2 \times 5 = 4 \times 5 = 20$$
