(a)

(b)

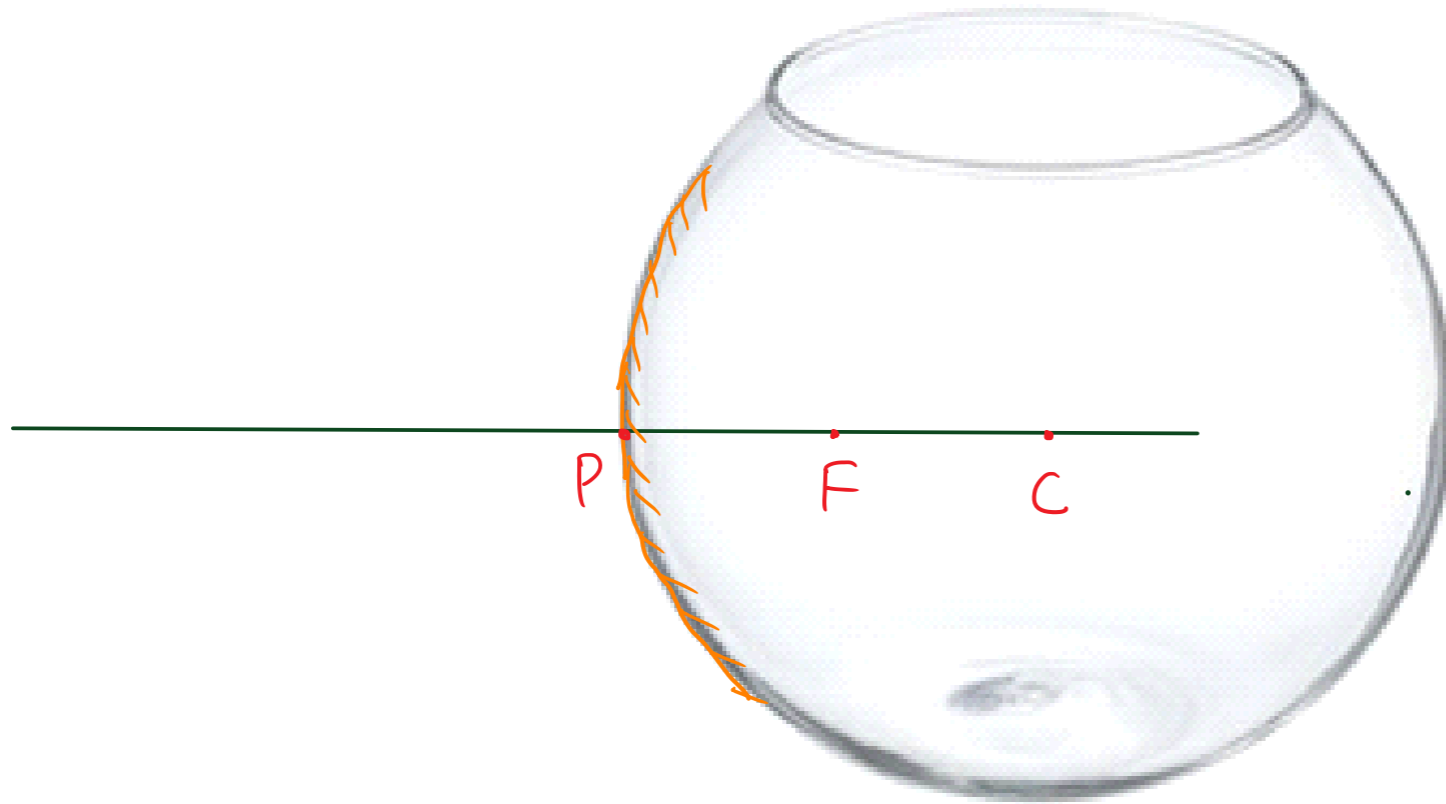

A spherical mirror is that mirror whose reflecting surface is the part of a hollow sphere of glass.

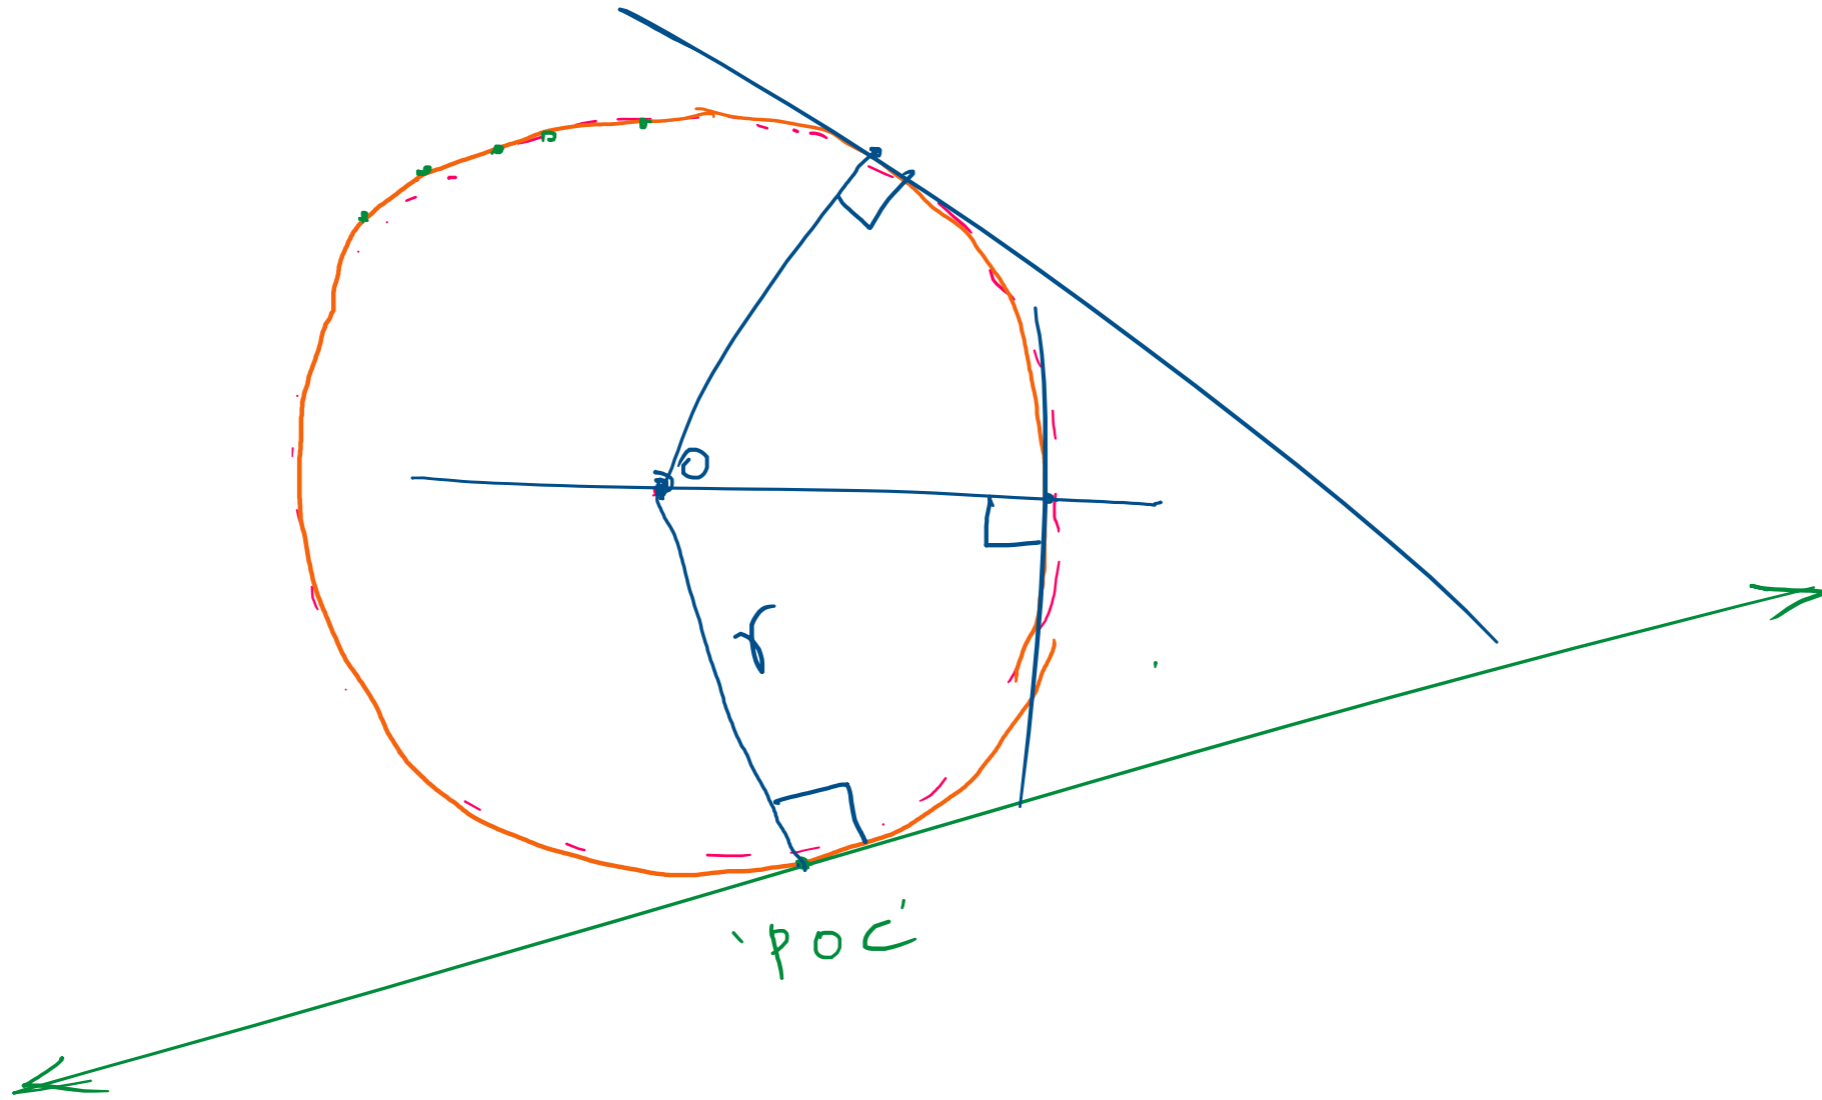

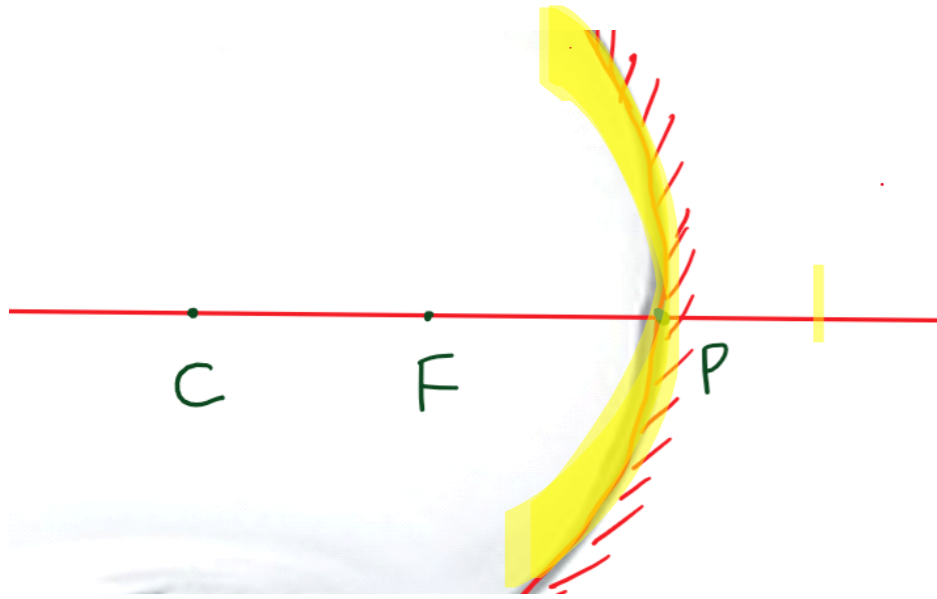

A spherical mirror, whose reflecting surface is curved inwards, that is, faces towards the centre of the sphere, is called a concave mirror.

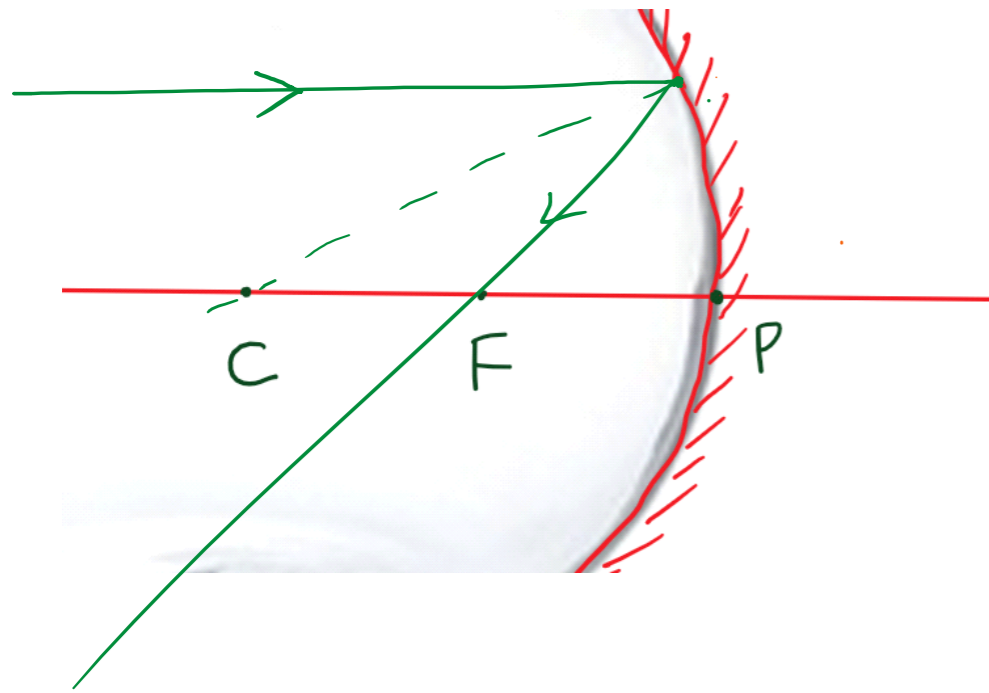

A spherical mirror whose reflecting surface is curved outwards, is called a convex mirror.

- The centre of the reflecting surface of a spherical mirror is a point called the pole. It lies on the surface of the mirror. The pole is usually represented by the letter P.
- The centre of the sphere of which the reflecting surface of a spherical mirror forms a part, is called the centre of curvature of the mirror. It is represented by the letter C

- The radius of the sphere of which the reflecting surface of a spherical mirror forms a part, is called the radius of curvature of the mirror. It is represented by the letter R
- An imaginary straight line passing through the pole and the centre of curvature of a spherical mirror is called the principal axis.

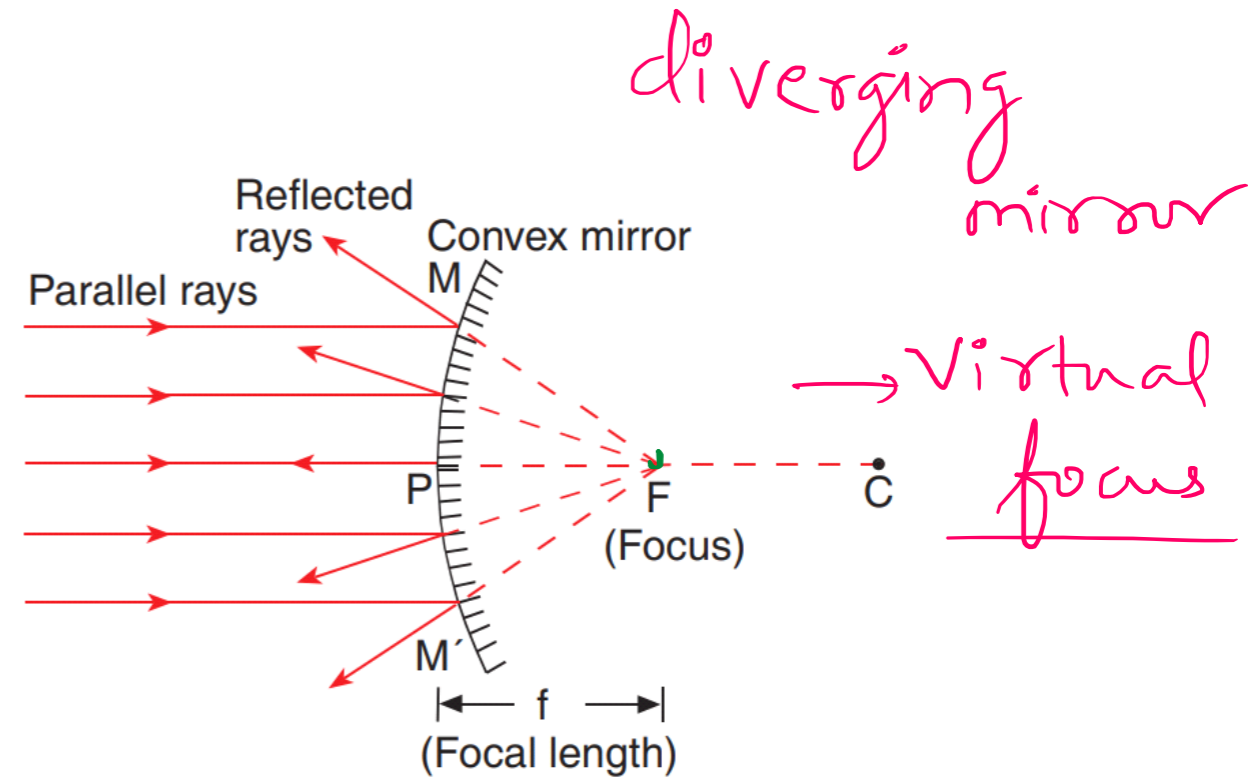

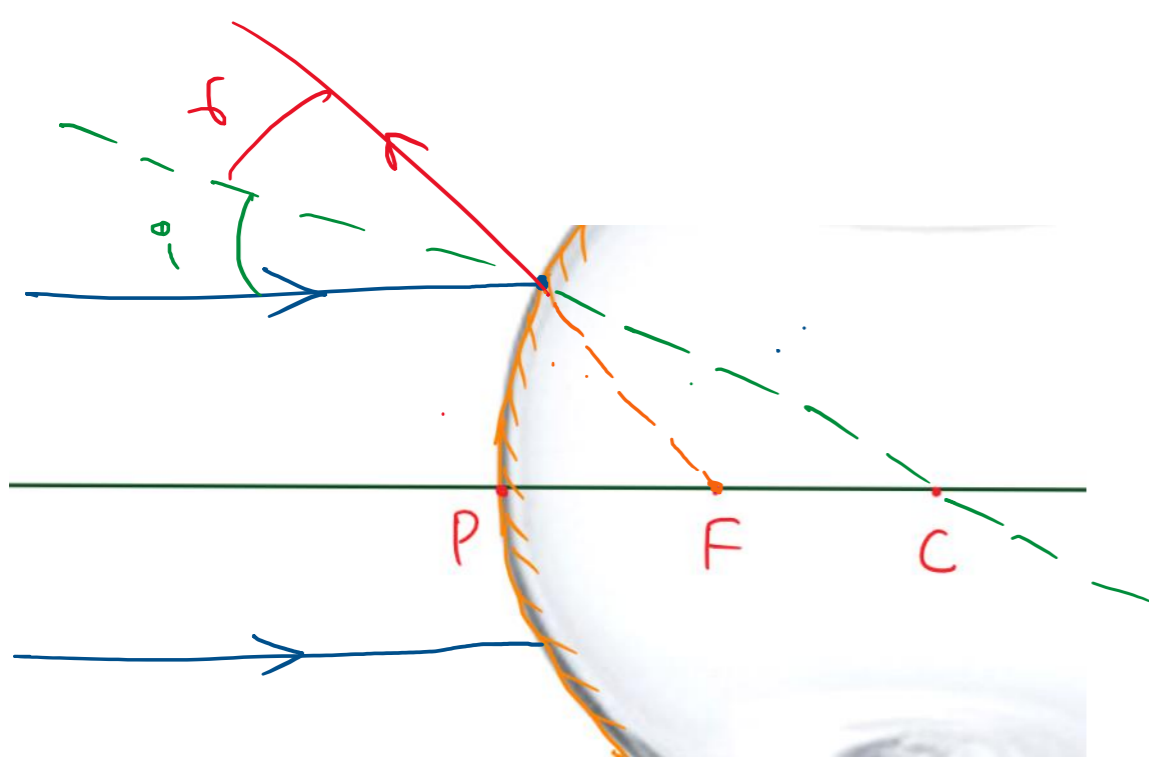

# Converging mirror

The principal focus of a concave mirror is a point on its principal axis to which all the light rays which are parallel and close to the axis, converge after reflection from the concave mirror.

The focal length of a concave mirror is the distance between its pole and principal focus.

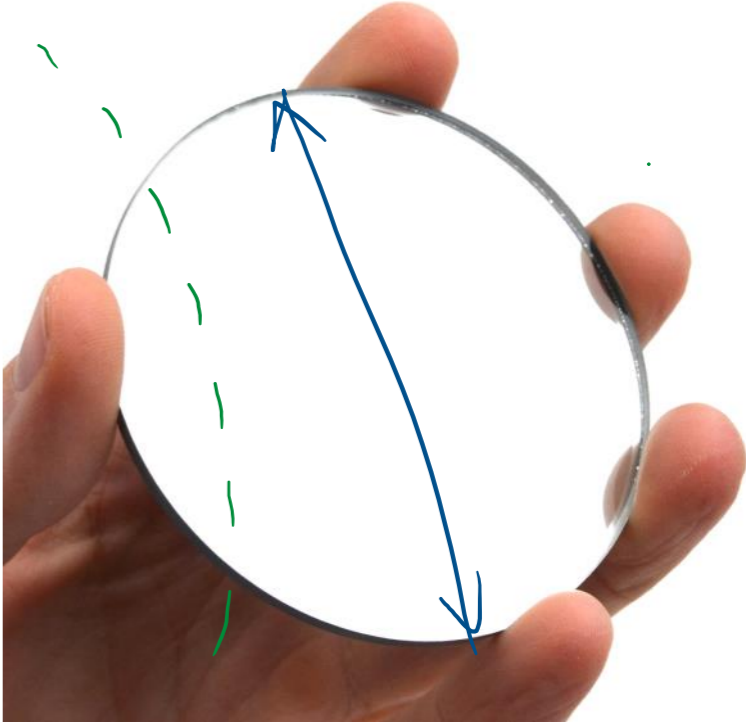

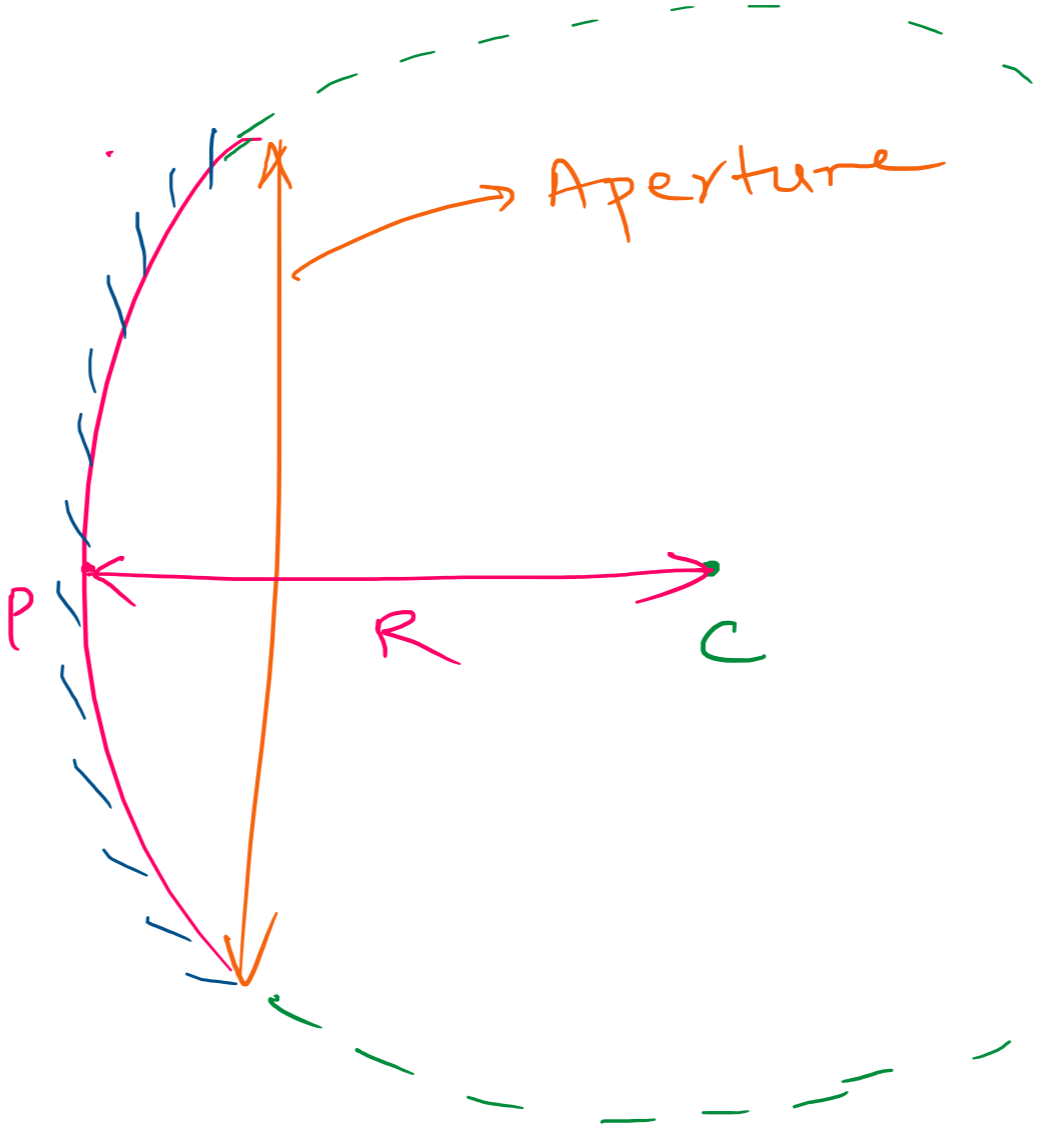

The principal focus of a convex mirror is a point on its principal axis from which a beam of light rays, initially parallel to the axis, appears to diverge after being reflected from the convex mirror.

# Relation between Radius of Curvature and Focal Length of a Spherical Mirror

$$(R = 2f)$$

The diameter of the reflecting surface of spherical mirror is called its aperture.

When aperture is smaller than the radius of curvature, then 'F' is the midpoint of P & C

$$R = f + f$$

$$R = 2f$$

largest  $R \rightarrow C$
