

Trigonometry Identities & Telescoping Tricks

1. Basic Trigonometric Identities

$$\sin^2\theta + \cos^2\theta = 1$$

$$1 + \tan^2\theta = \sec^2\theta$$

$$1 + \cot^2\theta = \operatorname{cosec}^2\theta$$

$$\sin(-\theta) = -\sin\theta, \cos(-\theta) = \cos\theta, \tan(-\theta) = -\tan\theta$$

2. Angle Transformation Identities

$$\sin(90^\circ - \theta) = \cos\theta$$

$$\cos(90^\circ - \theta) = \sin\theta$$

$$\tan(90^\circ - \theta) = \cot\theta$$

$$\sin(180^\circ - \theta) = \sin\theta$$

$$\cos(180^\circ - \theta) = -\cos\theta$$

$$\tan(180^\circ - \theta) = -\tan\theta$$

3. Trigonometric Ratios of Standard Angles

θ	0°	30°	45°	60°	90°
----------	-----------	------------	------------	------------	------------

$\sin\theta$	0	$1/2$	$1/\sqrt{2}$	$\sqrt{3}/2$	1
--------------	---	-------	--------------	--------------	---

$\cos\theta$	1	$\sqrt{3}/2$	$1/\sqrt{2}$	$1/2$	0
--------------	---	--------------	--------------	-------	---

$\tan\theta$	0	$1/\sqrt{3}$	1	$\sqrt{3}$	undefined
--------------	---	--------------	---	------------	-----------

4. Multiple Angle Identity (Used in Your Question)

$$\frac{\cos\theta}{\cos 3\theta} + \frac{\cos 3\theta}{\cos 9\theta} + \frac{\cos 9\theta}{\cos 27\theta} = \frac{1}{2} (\tan 27\theta - \tan\theta)$$

This is a telescoping identity where each term cancels internally.

Trigonometry Identities & Telescoping Tricks

5. Special Telescoping Series in Trigonometry

$$\tan\theta + \tan 2\theta + \tan 4\theta + \dots + \tan(2^n\theta)$$

Can sometimes be simplified using identities or induction.

Key idea: look for cancelation patterns.

Another example:

$$\cot A - \tan A = 2 \cot 2A$$
