# Scheduling -Concepts and MS Project

# About the Faculty- Venkat Annapragada

# About the Student

Please give a brief introduction covering the following aspects:

- Education
- Work Experience Years, Industry, Roles
- Project Management Experience
- Purpose of wanting to learn Microsoft Project
- Anything else you think is important for me to know

OVER TO YOU !

#### **1. BASICS OF PROJECT AND PROJECT MANAGEMENT**

- Definition of Project
- Definition of Project Management
- Product Life Cycle and Project Life Cycle
- Constraints in a Project
- Essential Conditions for success of a project

#### 2. WORK BREAKDOWN STRUCTURE

- Create WBS
- WBS based on phases of Project
- WBS based on Major Deliverables of Project
- WBS for construction Project
- Exercise

#### **3. ESTIMATION**

- Principles of Estimation
- Bottom Up Estimation using WBS

#### **4. BASICS OF SCHEDULING**

- Resources and Assigning Resources
- Over Allocation of Resources
- Resource Levelling
- Guidelines for Resource Levelling

#### 9. MICROSOFT PROJECT – STEP 5

- Baseline
- Tracking
- Reports
- Impact of Task Types
- Manual Scheduling

# Definition of Project

A Project has the following three characteristics :

#### UNIQUE

Every project creates a different product, service or result. E.g, construction of a shopping mall. Assembly line manufacture of car parts is NOT a project.

#### TEMPORARY

Project has a definite beginning and end. Project is said to complete once objectives are achieved. E.g., construction of flyover with a project deadline. Ongoing work in HR and Finance departments are NOT projects.

#### PROGRESSIVELY ELABORATED

The project scope is broadly described early in the project and made more explicit as the project progresses. E.g., When starting to build a house you need to have a broad layout plan in front of you which will be elaborated as the construction progresses.

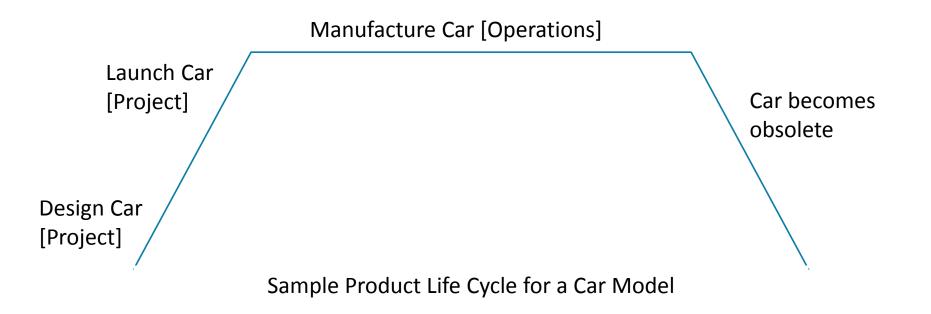

# Definition of Project Management

The application of KNOWLEDGE, SKILLS, TOOLS and TECHNIQUES to project activities to meet project requirements

### Product Life Cycle

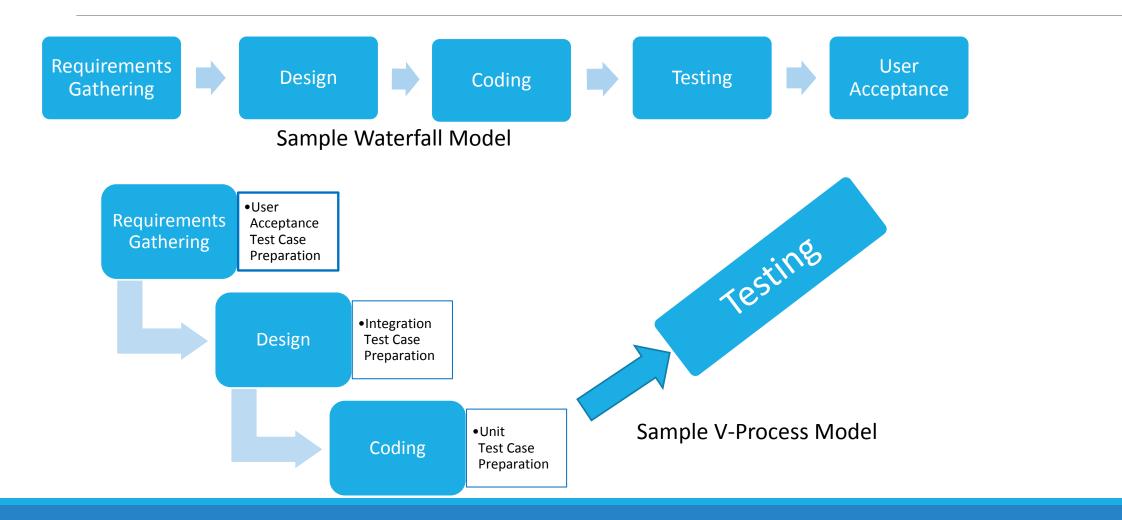

A Product Life Cycle is undertaken to launch a Product. It may have SEVERAL PROJECTS [each with their own project life cycles] and OPERATIONS. Product phases are generally SEQUENTIAL and NON-OVERLAPPING.

# Project Life Cycle

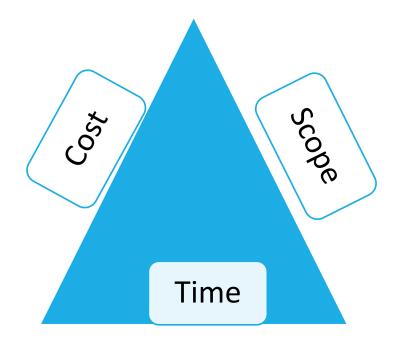

- Project Life Cycle includes all phases required for a project to create a product, service or result
- It is Industry specific and can be different for different projects
- It is divided into project phases for better control of the project
- Phase end reviews are conducted to assess project progress
- Phases can be either sequential or overlapping
- Phases can occur only once or be Iterative
- Common Project Life Cycles in IT Industry :
  - i. Waterfall Model
  - ii. V-Process
  - iii. Agile

### Project Life Cycles in IT Industry

### Constraints in a Project

- Constraints are factors which project managers must manage simultaneously in a project.
- The three major factors are Scope, Time and Cost which are also called as Triple Constraints.
- Other important factors are quality, customer satisfaction, risk and human resources.

## Conditions for Project Success

When do we say a Project is successful?

- A. When Project satisfies Predefined Project Success Criteria relating to TIME, COST and QUALITY
- Top 5 conditions for Projects to be successful:
  - i. Thorough Project Planning and review throughout the Project
  - ii. Overall Goals of the Project should be clearly specified
  - iii. Project should have clear reporting and communication lines
  - iv. The core project team needs to be fully competent
  - v. All important stakeholders should be committed to Project's success

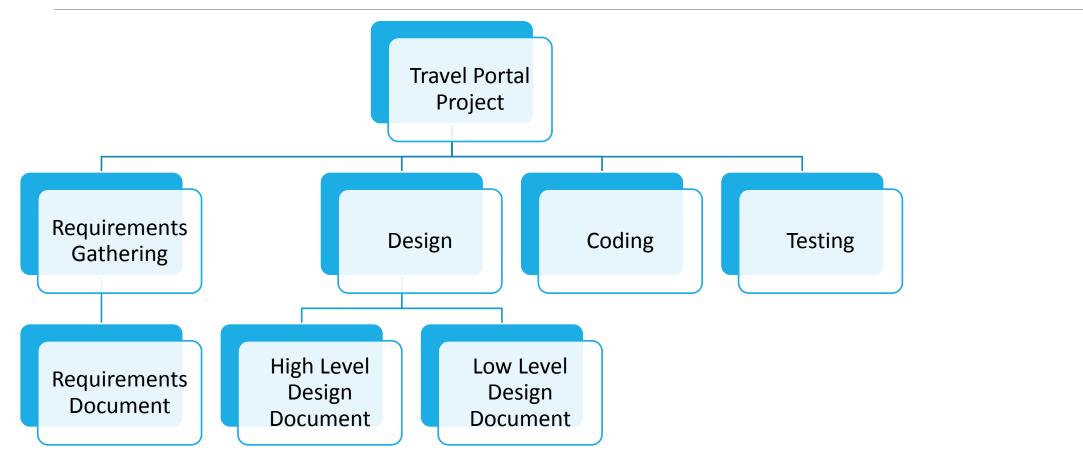

Source : https://www.apm.org.uk/conditions-for-project-success

### Create WBS

 After defining project scope, the project deliverables need to be broken down into smaller, more manageable components

- This is done by a technique called Decomposition which produces the Work Breakdown Structure [WBS]
- WBS is an hierarchical decomposition of the work to be carried out.
- The deliverables are identified at the lowest level of the WBS known as Work Packages
- Work Packages are further decomposed into activities that represent the work effort required to complete the work package
- WBS can be created based on the phases of the project or based on the major deliverables

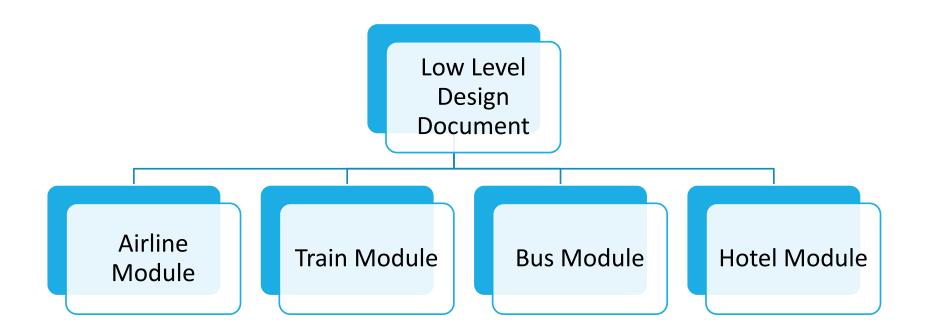

### WBS – based on Phases of Project

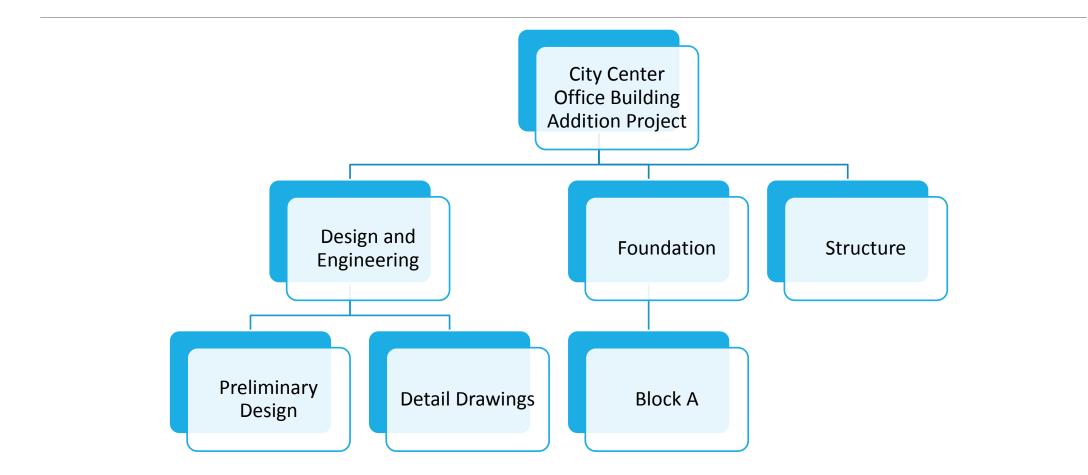

### WBS – based on Major Deliverables

# WBS – Combination of phases and deliverables

### WBS for Construction Project

#### Exercise

For your current/previous Project :

- Create WBS based on phases of Project
  - i. Identify phases of Project
  - ii. Identify Work Packages for each phase
  - iii. Identify Activities for each Work Package
- Create WBS based on major deliverables of Project
  - i. Identify major deliverables of Project
  - ii. Identify Work Packages for each major deliverable
  - iii. Identify Activities for each Work Package

# Principles of Estimation

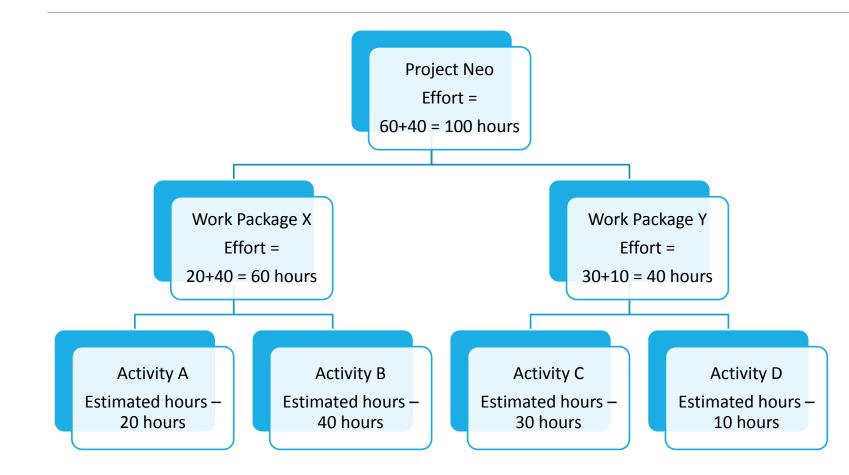

- Estimate is an FORECAST of the Effort or Duration or Cost of a Project
- It is usually expressed as a point estimate with an percentage range of variance
- Lower the variance more the accuracy of the Estimate
- Rarely Estimate can be given with 100% Accuracy
- Example:
  - i. Estimated Man-hours required to construct a house is 50000 hours +/- 20%
  - ii. Estimated Duration to complete construction of a house is 12 months +/- 10%
  - iii. Estimated Cost of constructing an house is 30 Lakhs +/- 15%
- To be able to Estimate Effort/Duration/Cost it is necessary to know the Size of the Project
- Size of Project is calculated based on Requirements
- Hence accuracy of Estimates depends on Clarity of Requirements

### **Bottom Up Estimation**

Bottom Up Estimation:

- Can be used when requirements are well defined.
- WBS is prepared for all requirements and work packages identified.
- Activities for all work packages are identified.
- Estimation is done for each activity of a work package with the greatest level of specified detail and then aggregated.
- Other Estimation techniques can also be used to estimate at activity level.
- The estimate for a work package is the cumulative effort of all activities of that work package.
- The estimates of all work packages are then "rolled up" to derive estimates of different phases of project as well as overall project.
- This is called as 100% Rule. The estimate of a parent node is equal to cumulative estimates of its child nodes.
- This technique is time consuming and costly. But also more accurate than other techniques.

### Bottom Up Estimation - Example

# Understanding a Schedule

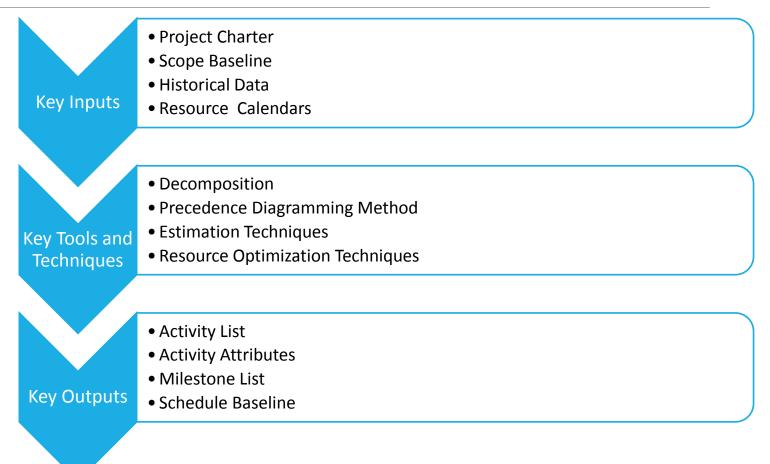

A schedule or a timetable, as a basic time-management tool, consists of a list of times at which possible tasks, events, or actions are intended to take place, OR of a sequence of events in the chronological order in which such things are intended to take place. ~ Wikipedia

Date/Day	Match	Place	Day/Night	
Feb 14 - Sat	New Zealand v Sri Lanka	Christchurch	Day	
Feb 14 - Sat	Australia v England	Melbourne	Day/night	
Feb 15 - Sun	South Africa v Zimbabwe	Hamilton	Day/night	
Feb 15 - Sun	India v Pakistan	Adelaide	Day/night

# What is Scheduling ?

Scheduling is the <u>process</u> of arriving at a schedule using appropriate tools and techniques given certain inputs

# Examples of Schedules

School Time Table

Airport/Railways/Bus Schedules

**Cricket Match Schedules** 

Anything else you can think of?

How important is scheduling in above examples?

As you can see Scheduling as a concept is used widely and is not specific to only Project Management

In PMBOK Scheduling is part of Time Management process group which has the highest number of processes defined among all Knowledge groups [7]

### **Define Activities**

- The WBS work packages are further broken down into ACTIVITIES or TASKS.
- This results in what is called as an Activity List.
- Activity List includes all the activities that are required for the project and described in sufficient detail so that others can understand.
- Example: Activity List for Work Package "High Level Design Document"

Activity ID	Activity Name
1.2.1.1	Get Inputs for High Level Design Document
1.2.1.2	Prepare High Level Design Document
1.2.1.3	Review High Level Design Document
1.2.1.4	Rework High Level Design Document
1.2.1.5	Obtain Sign Off from Customer

### **Define Activities**

#### Activity List for Work Packages under "Low Level Design Document"

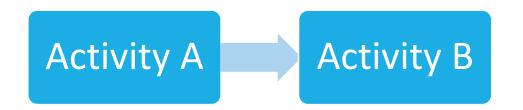

Module	Activity ID	Activity Name
Airline Module	1.2.2.1.1	Prepare Low Level Design Document
	1.2.2.1.2	Review Low Level Design Document
	1.2.2.1.3	Rework Low Level Design Document
Train Module	1.2.2.2.1	Prepare Low Level Design Document
	1.2.2.2.2	Review Low Level Design Document
	1.2.2.2.3	Rework Low Level Design Document
	1.2.2.5	Consolidate all LLD's
	1.2.2.6	Obtain Sign Off from Customer

### Sequence Activities

- Identify and document relationships among project activities.
- Tasks have an inherent dependency with few other tasks.
- For example testing activity depends on coding activity to have already been performed. Hence we can say that PREDECESSOR of testing activity is coding activity. These type of tasks need to be done in sequence.
- Few tasks do not have dependency on each other. For example coding for different modules A and B can be independent of each other. Such tasks <u>can</u> be done in parallel.
- Identifying tasks which have the potential to be done in parallel is an important aspect of scheduling.

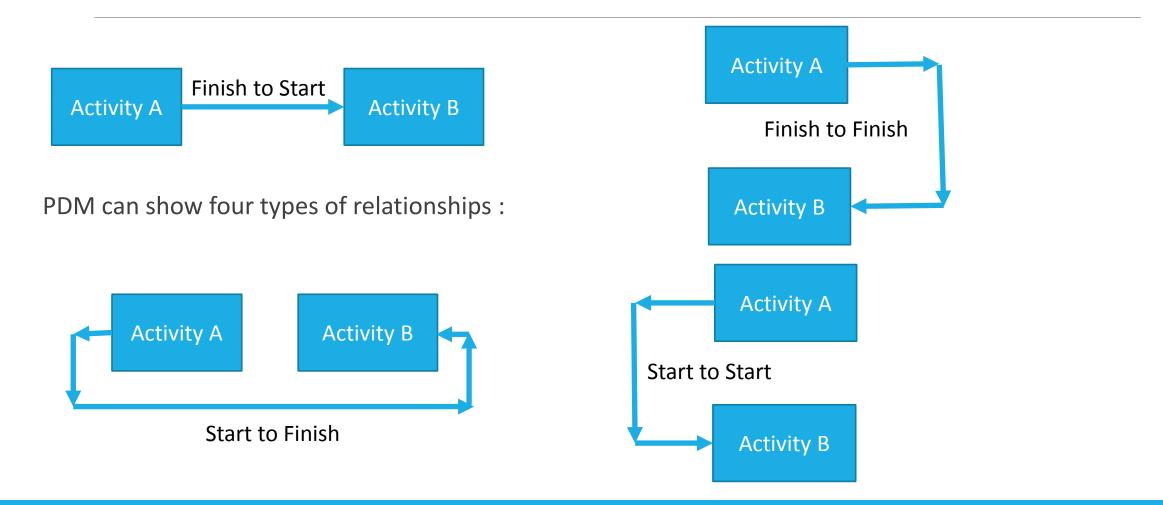

# Precedence Diagramming Method

- Relationships among activities are shown using Precedence Diagramming Method [PDM].
- In this method all activities are shown in boxes/nodes. The nodes are connected with arrows that indicate the type of relationship.
- Example:

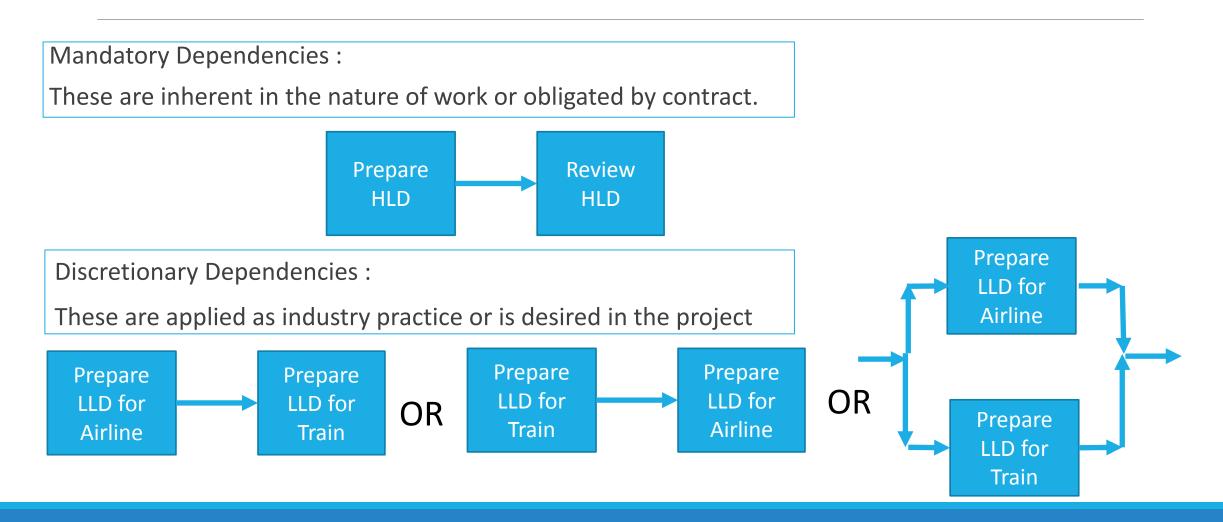

- Here Activity A is PREDECESSOR to Activity B.
- This is an example of Finish to Start Relationship since only on completion of Activity A can Activity B be started.

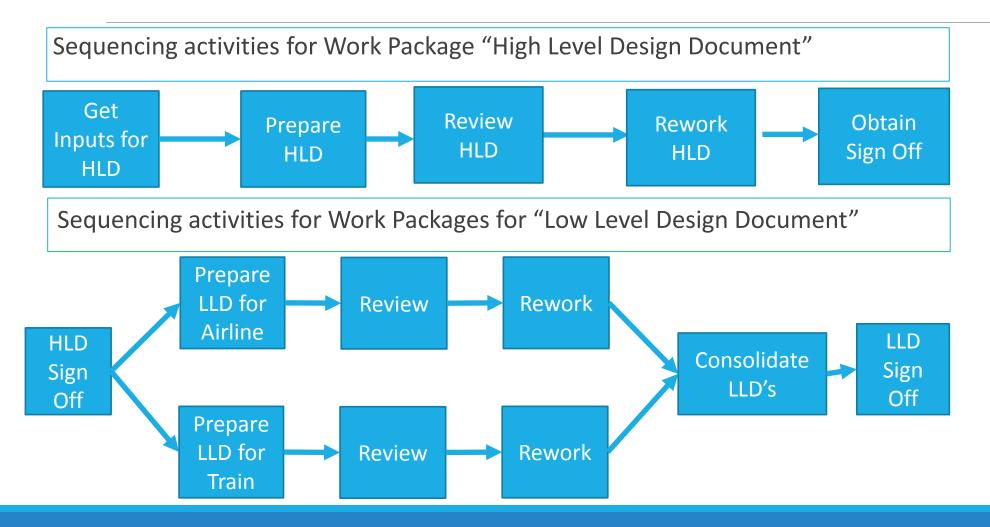

# Types of Relationships

# Types of Dependencies

# Task Network Diagram

# Activity Duration

- Number of work periods needed to complete the activity.
- Duration of an activity is calculated using the Task Rule which is as follows : Work = Duration \* Resource Units
  - i. Work is the Effort estimated for the activity. Various Estimation techniques discussed previously can be used. This is usually expressed in hours.
  - ii. Resource Units equals the number of resources that are assigned to the activity and the number of hours per day they are available for this activity.
  - iii. Duration calculated from above Rule is usually expressed in days.
- Example :

An High Level Design Document is required to be prepared. It's estimated effort is 40 hours. Two resources are assigned to it. Both of them can spare 4 hours each daily for this activity. What is the Duration of this Activity ?

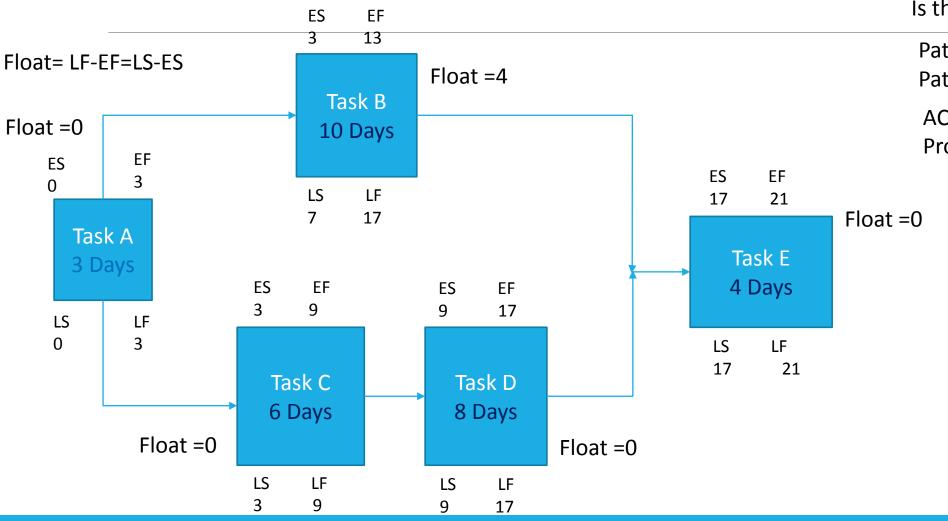

Duration of activity is 5 days.

# Critical Path Method [CPM]

This method involves the following steps :

- Calculate the Duration for all activities on the Task Network Diagram.
- Calculate the early start [ES], early finish [EF], late start [LS] and late finish [LF] for all activities by using Forward pass and Backward pass techniques.
- Identify number of paths on the Network Diagram.
- Calculate the total duration of each path.
- Identify path with longest duration. This path is called Critical Path.
- The Critical Path Duration will be the MINIMUM Project Duration.
- Calculate Total Float for all activities with the formula [LS-ES] or [LF-EF].
- Total Float is the amount of time an activity can be delayed without delaying the project finish date. Float is also called as Slack.
- Identify Activities on Critical Path. These will have zero float which means they HAVE to start and finish on time.

### Illustration

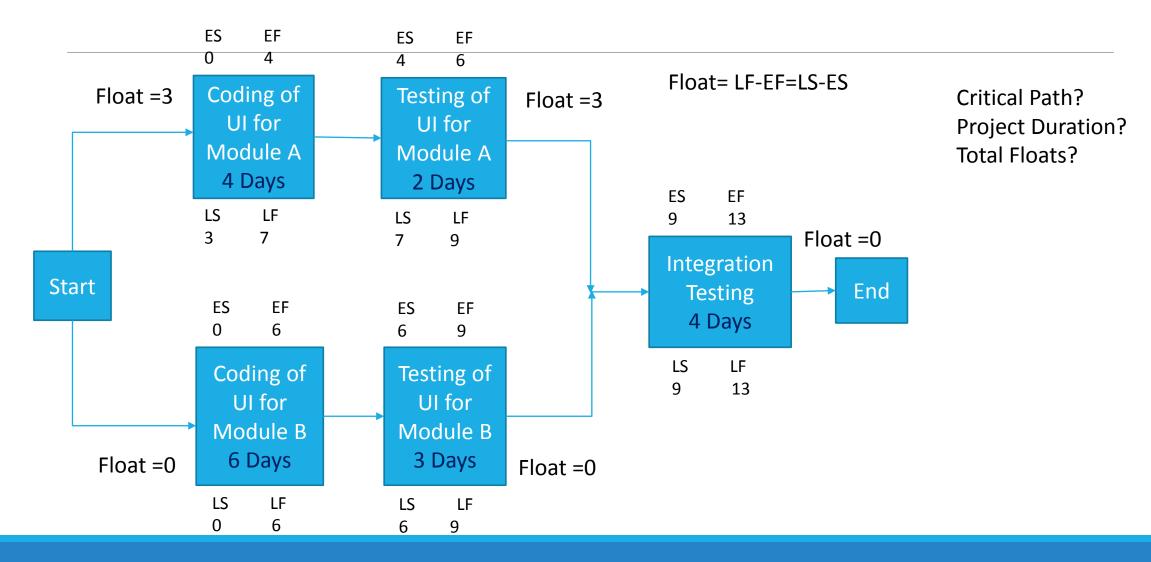

Customer wants Project to Be completed in 25 days. Is this feasible?

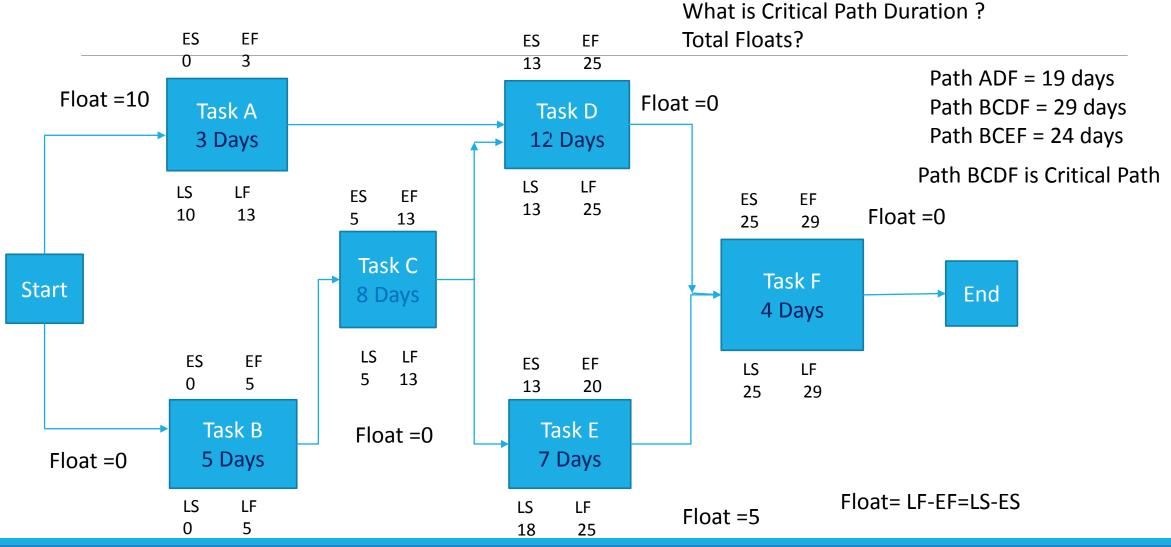

Path ABE = 17 days Path ACDE = 21 days ACDE is Critical Path.

Project Duration is 21 days

### Exercise

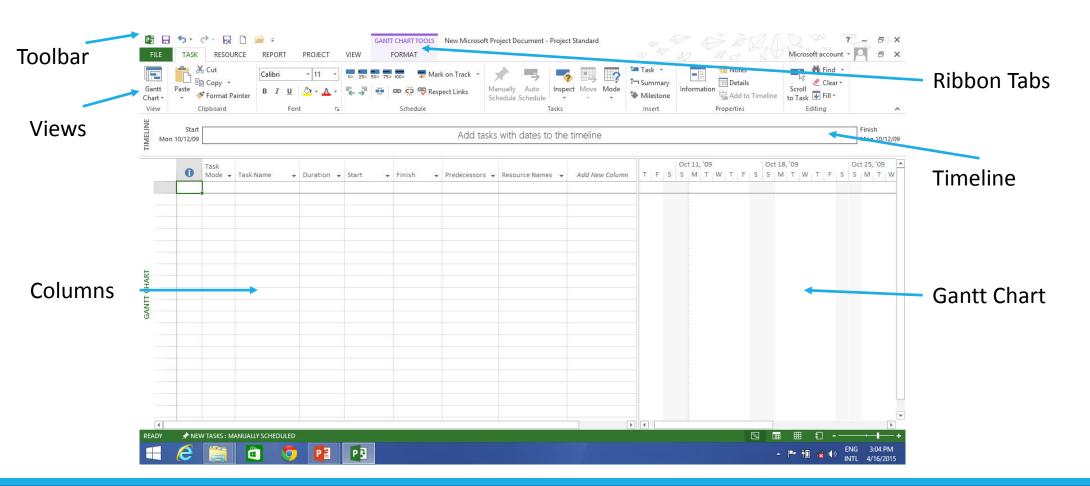

### Exercise

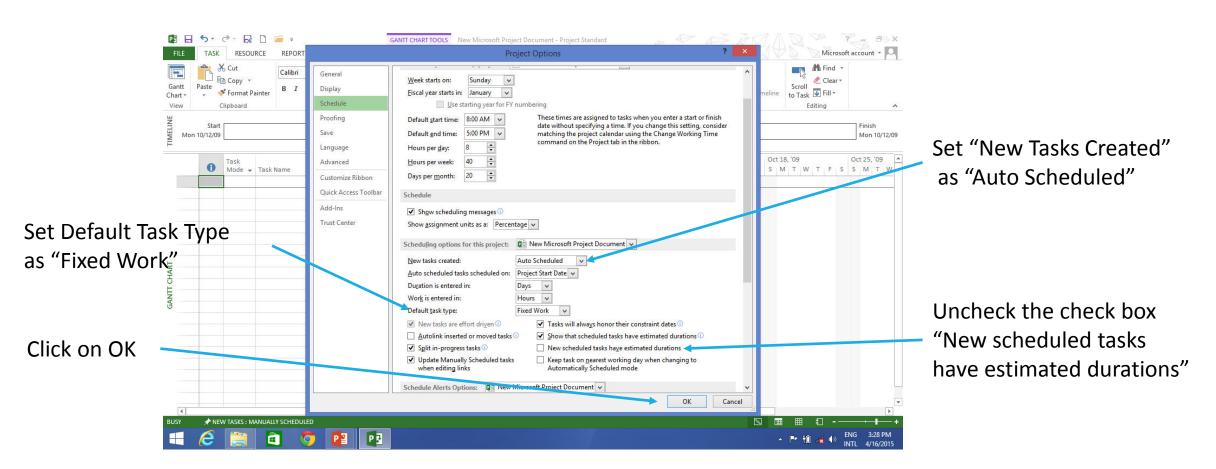

#### **Open a new Microsoft Project Document**

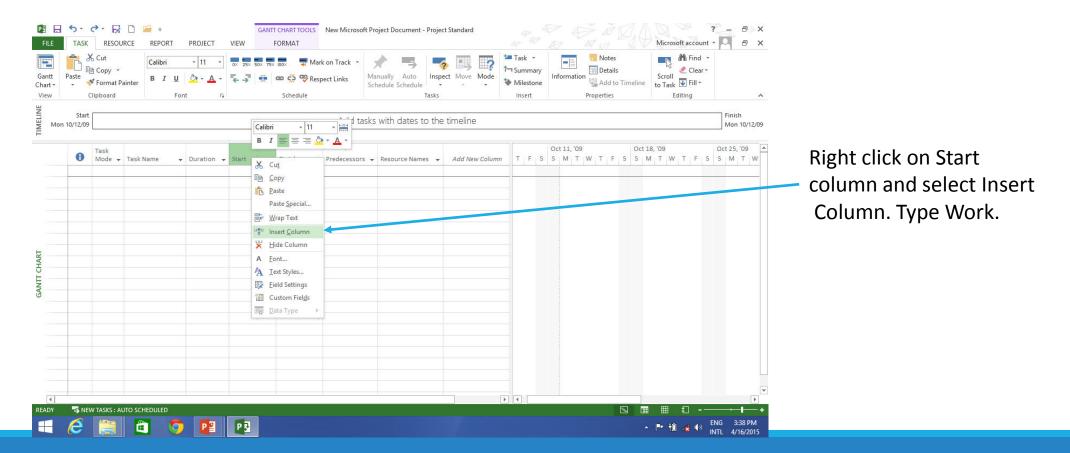

### Setup - Options

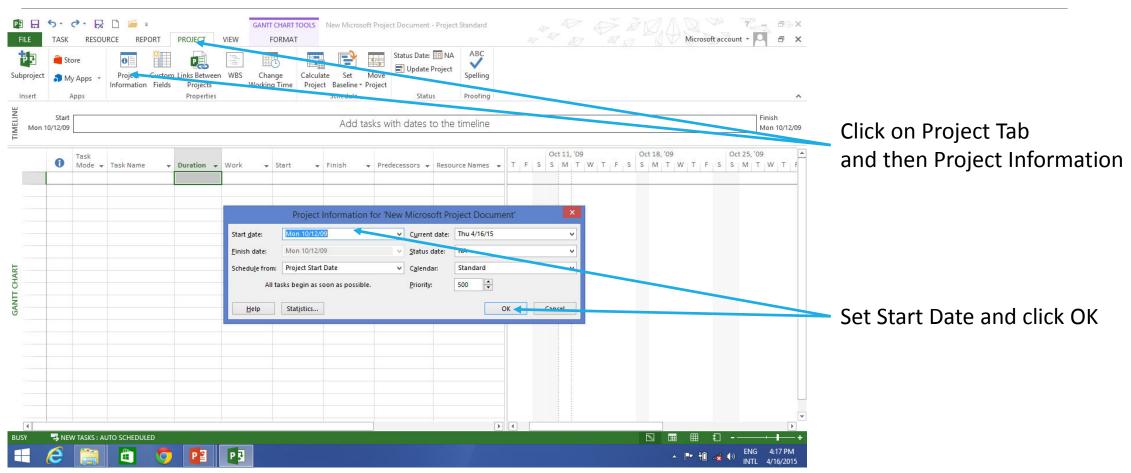

### Go to File -> Options -> Schedule

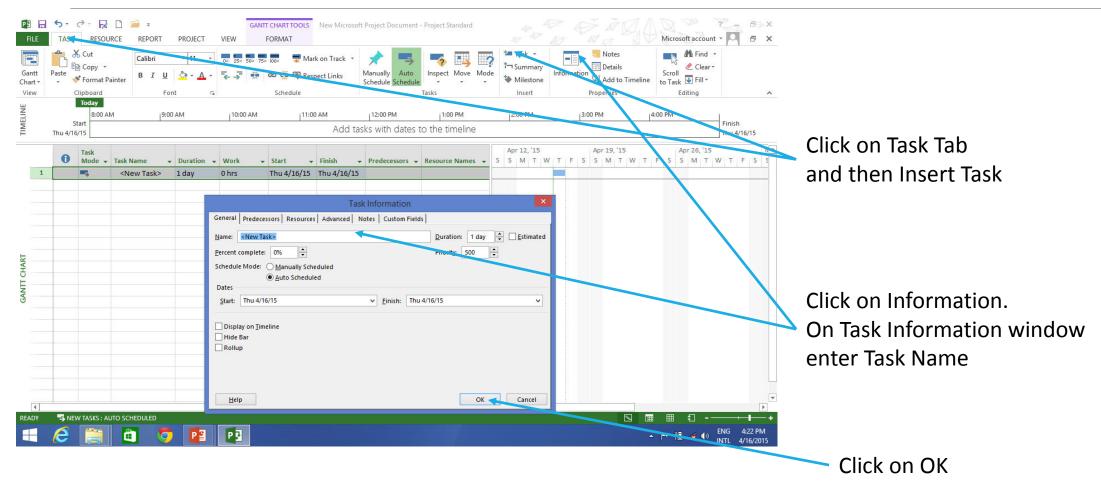

# Setup - Work Column

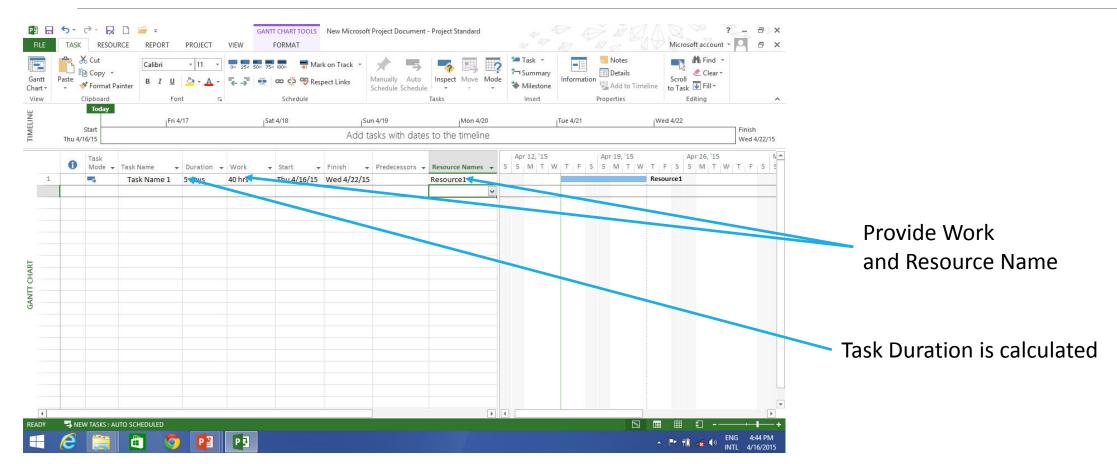

# Setup - Project Information

## Entering Task

# Task Duration Calculation

# Task Rule

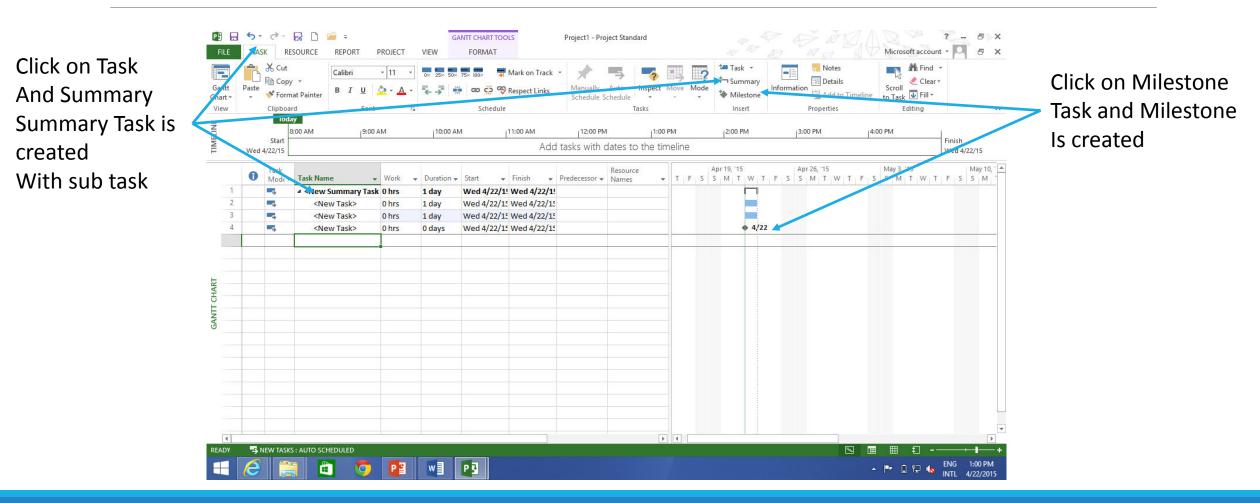

In the Auto Scheduled mode Microsoft Project follows task rule which is defined below :

```
Work = Duration * Resource Units
```

[1 Resource unit = 8 hours]

- When two of the above three variables are provided to the tool, it will calculate the third variable using the task rule.
- □ If Task Type "Fixed Work" is used the user has to provide Work and Resource details and the tool calculates Duration.
- If Task Type "Fixed Duration" is used the user has to provide Duration and Resource details and the tool calculates Work.
- □ If Task Type "Fixed Units" is used the user has to provide Resource details and either Work or Duration. The tool calculates the third variable.
- In all the above cases whatever variable is "Fixed" will not be modified by the tool.

## Summary Task and Milestone Task

### Creating Tasks in WBS Format – Exercise

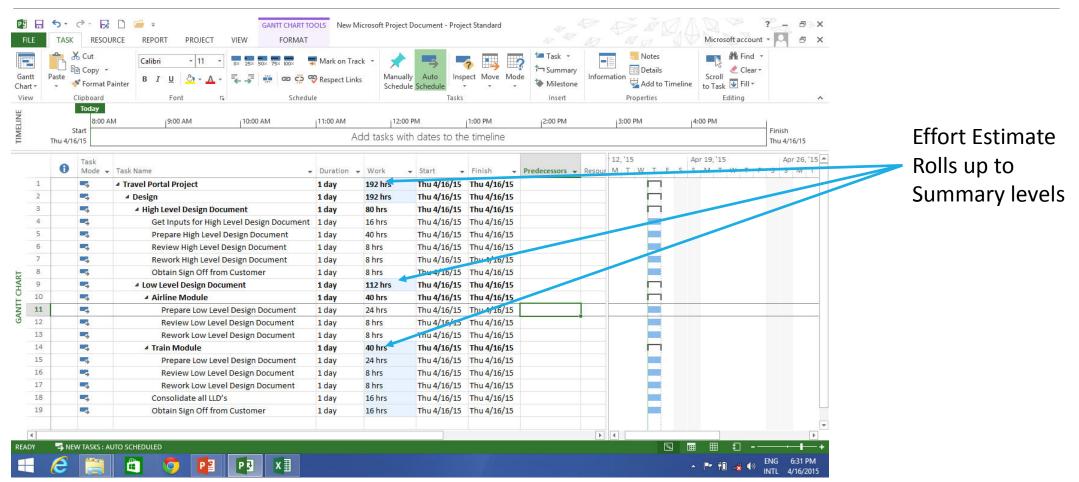

Create a Schedule for the following list of activities:

Activity Id
indicates
WBS Level

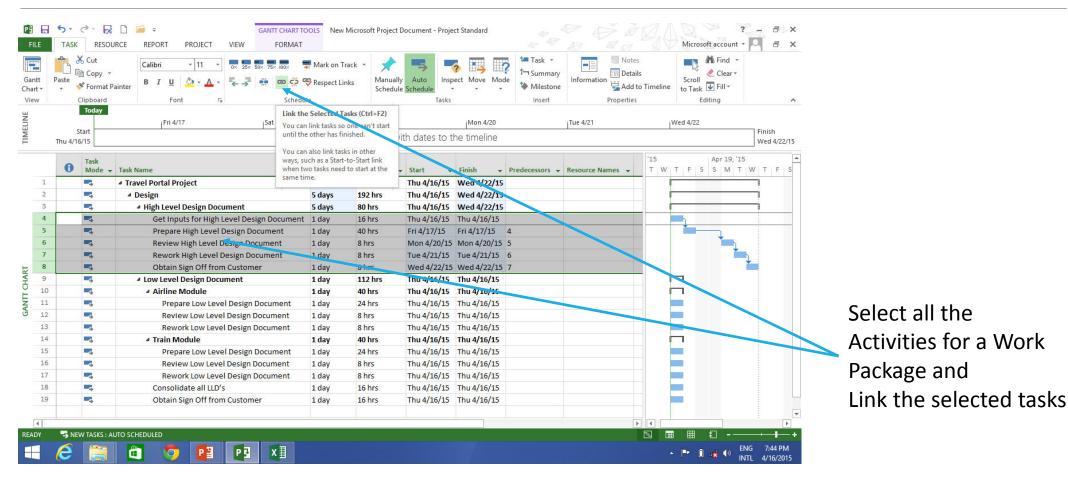

Activity ID	Activity Name	Effort [Hrs]
1	Travel Portal Project	
	Design	
1.2		
	High Level Design Document	
1.2.1		
1.2.1.1	Get Inputs for High Level Design Document	16
1.2.1.2	Prepare High Level Design Document	40
1.2.1.3	Review High Level Design Document	8 🔶
1.2.1.4	Rework High Level Design Document	8
1.2.1.5	Obtain Sign Off from Customer	8
	Low Level Design Document	
1.2.2		
1.2.2.1	Airline Module	
1.2.2.1.1	Prepare Low Level Design Document	24
1.2.2.1.2	Review Low Level Design Document	8
1.2.2.1.3	Rework Low Level Design Document	8
1.2.2.2	Train Module	
1.2.2.2.1	Prepare Low Level Design Document	24
1.2.2.2.2	Review Low Level Design Document	8
1.2.2.3	Rework Low Level Design Document	8
1.2.2.5	Consolidate all LLD's	16
1.2.2.6	Obtain Sign Off from Customer	16

Effort required for only last level of WBS

=	Rew Tasks : Auto Schedule									

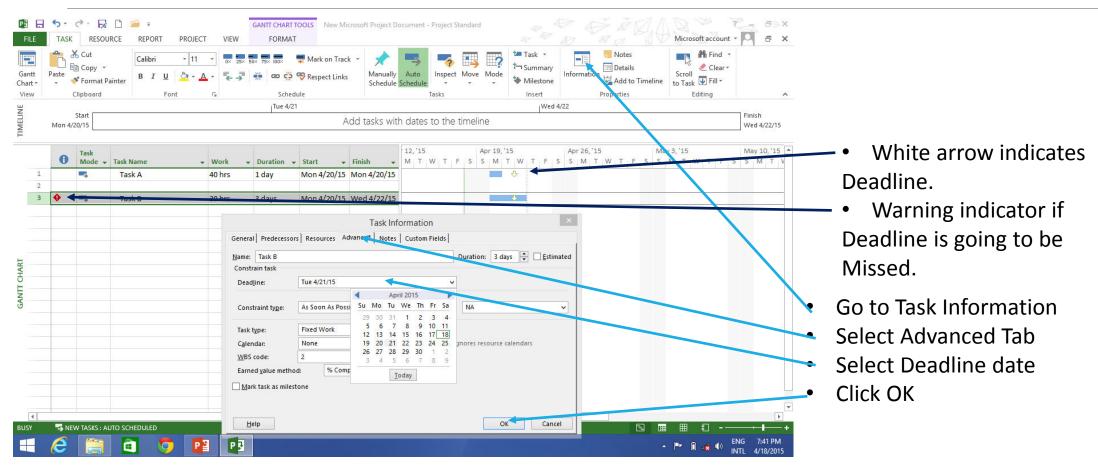

# Constraints and Deadlines

- To keep a tighter control on when activities get executed.
- There are 8 constraints in total out of which 2 are flexible.
- The flexible constraints are "As soon as possible" and "As late as possible". These are default constraints depending on whether forward or backward scheduling was selected under project information.
- The remaining 6 constraints are inflexible and are associated with a calendar date.
- Constraints override predecessor relationships. Even though the task link continue to be shown they are not maintained once constraints are set.
- They are recommended only in case of external dependencies which need to be tracked.
- Deadlines are better recommended for tracking customer drop dead dates.
- Deadlines do not override predecessor relationships.

### Setting a Constraint

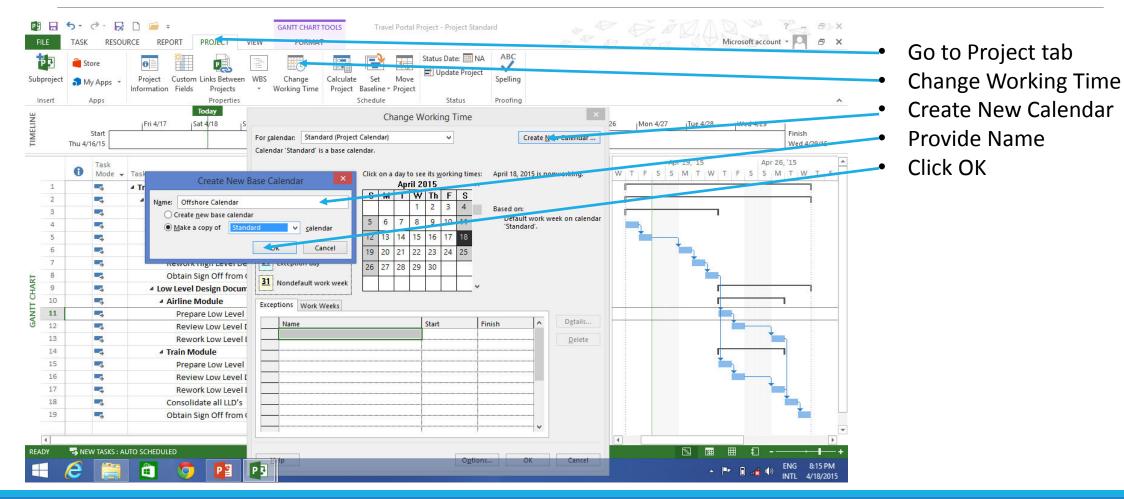

# Setting a Deadline

# Calendars

- There are three calendar templates on Microsoft Project : Standard, Night Shift and 24 hours
- Create a new calendar using one of these
- Change working time for this new calendar by changing default details under work weeks.
- Provide location holiday list under Exceptions
- Set Project Calendar under Project Information
- Assign Resource Calendar to resources under resource sheet
- Track Resource specific leaves under Exception of Resource Calendar
- Assign Task Calendar to tasks under task information
- Create multiple calendars for teams working at different locations

### Create a Calendar

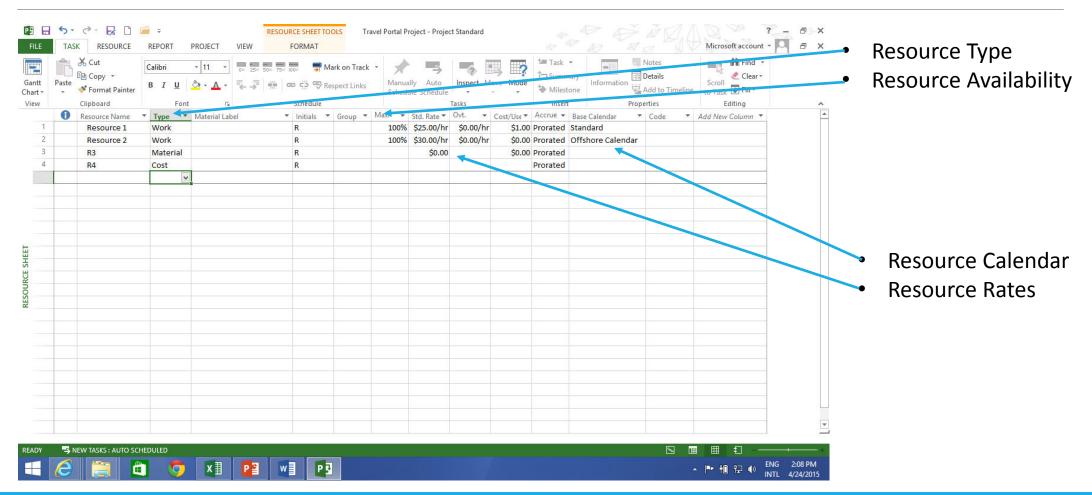

### Resources

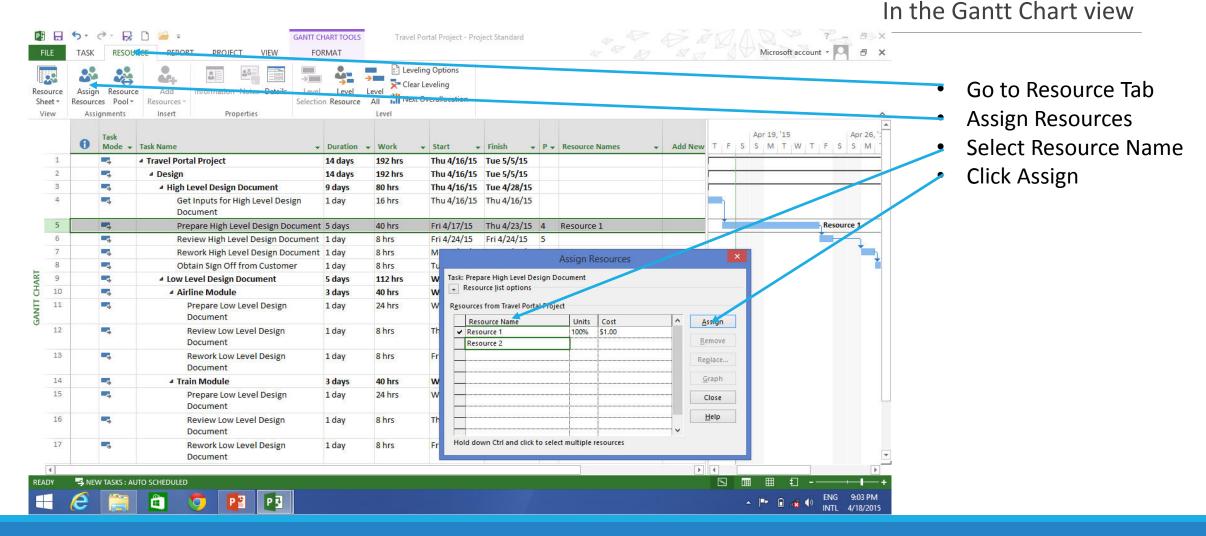

- Create Resources under Resource sheet
- Resources are of three types :
  - Work People and equipment
  - Material Consumables
  - Cost Associated with an activity
- If a resource is available for less than 100% for this project specify it under Maximum Units.
- Provide Standard Rates, Overtime Rates, Cost per Use
- Under Resource Tab use Assign Resources to assign resources to tasks
- Use Resource Pool to share resources across projects

### **Resource Sheet**

#### In the Resource Sheet view

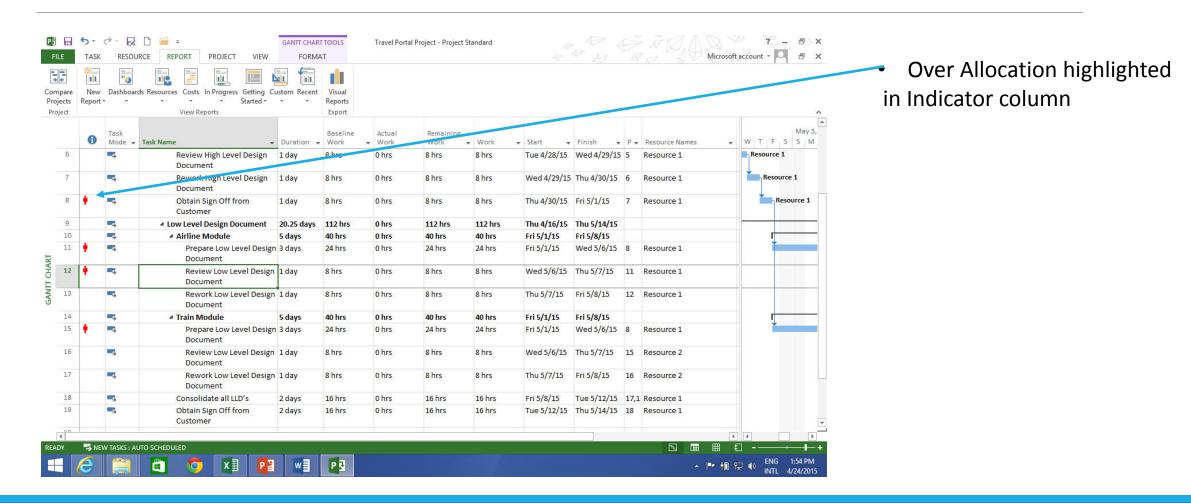

### Assigning Resources

# **Over Allocation of Resources**

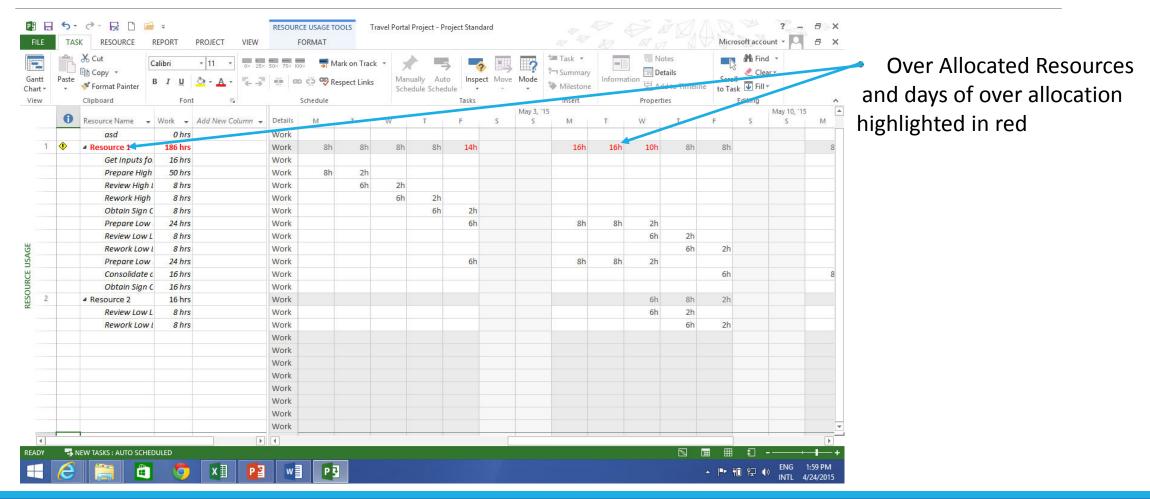

- Resources who are over allocated will have warning indicator
- Details of over allocation can be seen from Resource sheet, Resource Usage and Resource Graph.
- To resolve over allocation Resource Levelling technique is used
- The Resource Levelling options are:
  - Automatic Once set the tool ensures no Resource is over allocated. But there can be many under allocations resulting in project date getting extended.
  - Manual
    - i. Here tool looks for over allocation on minute or hourly or daily or weekly or monthly basis.
    - ii. Entire Project or only a set of activities can be levelled.
    - iii. Levelling order can be specified.
    - iv. Actions the tool can/cannot take can be specified.
    - v. Level for selected Resources or Tasks.

#### In the Resource Graph view

# **Resource Levelling**

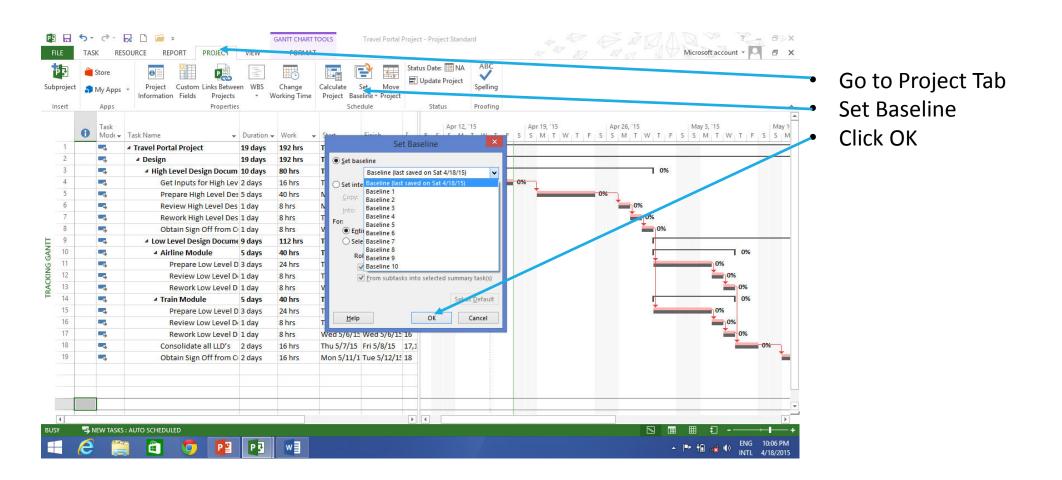

- Go to Resource Tab
- Levelling Options
- Set Levelling calculations
- Click Level All

# Guidelines for Resource Levelling

- When checking for over allocation look for over allocation on a day by day basis or week by week basis only.
- If a resource is over allocated on a particular day by one or two hours only you can take a judgment call whether you want to try to reduce that over allocation or leave it.
- If a resource is over allocated for few days of the week but is within the expected hours for that week you may again want to take a judgment call whether you want to try to reduce those over allocations or leave them.
- When choosing Levelling order choose either Standard or Priority and not ID only.
- Leveling within available slack has the advantage of not changing your project end date.
- Refer to the attached document for more information on above levelling orders.

# Exercise – Impact of Task Types

In a new Microsoft Project enter following details :

Task	Task Type	Effort Driven	Work	Duration	Resource Names
Task A	Fixed Work	checked	160 hours	Do not Enter	R1, R2
Task B	Fixed Duration	checked	Do not Enter	10 days	R3, R4
Task C	Fixed Duration	unchecked	Do not Enter	10 days	R5, R6
Task D	Fixed Units	checked	Do not Enter	10 days	R7, R8
Task E	Fixed Units	unchecked	Do not Enter	10 days	R9, R10

The tool calculates Work/Duration columns. What do you notice?

Change only the Resource column by removing one Resource for each task. What do you notice?

# Manual Scheduling

- Microsoft Project 2010 and 2013 provide Manual Scheduling option. This
  option can be used when only a high level WBS is available and task details
  will be known as the project rolls on.
- Enter a summary task and provide a start and finish date.
- Enter the tasks under the summary task as they become known with the start and finish date.
- If the dates for the tasks are not yet decided you can enter the text TBD.
- If the duration of the tasks exceeds the summary duration warning is highlighted. Right click and select Fix in Task Inspector to fix the errors.
