1

Mean :- Is found by adding together all the values of the data & then dividing the total by number of data values.

Median :- Is the middle value when all the data is arranged in order of size.

Mode :- is the value occurring the most often.

Range / Spread :- It is often useful to know how spread out the data is. It is possible for two sets of data to have same mean & median but very different spread.

The simplest measure of spread is the range. Range is simply the differences between the largest & smallest values in the data.
