

- ▶ **DAY FOUR**

- ▶ Working with Text Files
- ▶ **Local Users and Groups**
- ▶ Permissions
- ▶ Processes

CHAPTER 5: MANAGING LOCAL LINUX USERS AND GROUPS

- Users and Groups
 - Gaining Superuser Access
 - Managing Local User Accounts
 - Managing Local Group Accounts
 - Managing User Passwords
- 
- A decorative graphic consisting of several parallel white lines of varying lengths, slanted upwards from left to right, located in the bottom right corner of the slide.

- ▶ To manage local Linux users and groups and administer local password policies.

GOAL:

- Explain the role of users and groups on a Linux system and how they are understood by the computer.
- Run commands as the superuser to administer a Linux system.
- Create, modify, lock, and delete locally defined user accounts.
- Create, modify, and delete locally defined group accounts.
- Lock accounts manually or by setting a password-aging policy in the shadow password file.

OBJECTIVES:

- ▶ **Users and groups are used to control access to files and resources**
- ▶ **Users log in to the system by supplying their user name and password**
- ▶ **Every file on the system is owned by a user and associated with a group**
- ▶ **Every process has an owner and group affiliation, and can only access the resources its owner or group can access**

THE LINUX SECURITY MODEL

- ▶ Every user of the system is assigned a unique User ID number (the uid)
- ▶ Users' names and uids are stored in `/etc/passwd`
- ▶ Users are assigned a home directory and a program that is run when they log in (usually a shell)
- ▶ Users cannot read, write or execute each others' files without permission

USERS

- ▶ **Users are assigned to groups with unique group ID numbers (the gid)**
- ▶ **gids are stored in /etc/group**
- ▶ **Each user is given their own private group**
 - ▶ They can also be added to other groups to gain additional access
- ▶ **All users in a group can share files that belong to the group**

GROUPS

- ▶ **The root user: a special administrative account**
 - ▶ Sometimes called the *superuser*
 - ▶ **root** has complete control over the system
 - ▶ An unlimited capacity to damage the system!
 - ▶ You should not log in as **root** without a very good reason
 - ▶ Normal ("unprivileged") users' potential to do damage is limited

THE ROOT USER

- ▶ User names map to user ID numbers
- ▶ Group names map to group ID numbers
- ▶ Data stored on the hard disk is stored numerically

USER AND GROUP ID NUMBERS

▶ **Authentication information is stored in plain text files:**

- ▶ /etc/passwd
- ▶ /etc/shadow
- ▶ /etc/group
- ▶ /etc/gshadow

**/ETC/PASSWD, /ETC/SHADOW, AND
/ETC/GROUP FILES**

- ▶ **Server programs such as web or print servers typically run as unprivileged users, not as root**
 - ▶ Examples: **daemon, mail, lp, nobody**
- ▶ **Running programs in this way limits the amount of damage any single program can do to the system**

SYSTEM USERS AND GROUPS

- ▶ **To change your password, run `passwd`**
 - ▶ Insecure passwords are rejected
- ▶ **To start a new shell as a different user:**
 - ▶ `su`
 - ▶ `su -`
 - ▶ `su username`
 - ▶ `su - username`

CHANGING YOUR IDENTITY

- ▶ **Syntax**
 - ▶ `su [-] [user]`
 - ▶ `su [-] [user] -c command`
- ▶ **Allows the user to temporarily become another user**
 - ▶ Default user is root
- ▶ **The "-" option makes the new shell a login shell**

SWITCHING ACCOUNTS

- ▶ **Users listed in `/etc/sudoers` execute commands with:**
 - ▶ an effective user id of 0
 - ▶ group id of root's group
- ▶ **An administrator will be contacted if a user not listed in `/etc/sudoers` attempts to use sudo**

SUDO

- ▶ **Most common method is useradd:**
 - ▶ `useradd username`
- ▶ **Running useradd is equivalent to:**
 - ▶ edit `/etc/passwd`, `/etc/shadow`, `/etc/group`
 - ▶ create and populate home directory
 - ▶ set permissions and ownership
- ▶ **Set account password using passwd**
- ▶ **Accounts may be added in a batch with *newusers***

ADDING A NEW USER ACCOUNT

- ▶ **When user accounts are created, a private group is also created with the same name**
 - ▶ Users are assigned to this private group
 - ▶ User's new files affiliated with this group
- ▶ **Advantage: Prevents new files from belonging to a "public" group**
- ▶ **Disadvantage: May encourage making files "world-accessible"**

USER PRIVATE GROUPS

- ▶ Entries added to `/etc/group`
 - ▶ `groupadd`
 - ▶ `groupmod`
 - ▶ `groupdel`

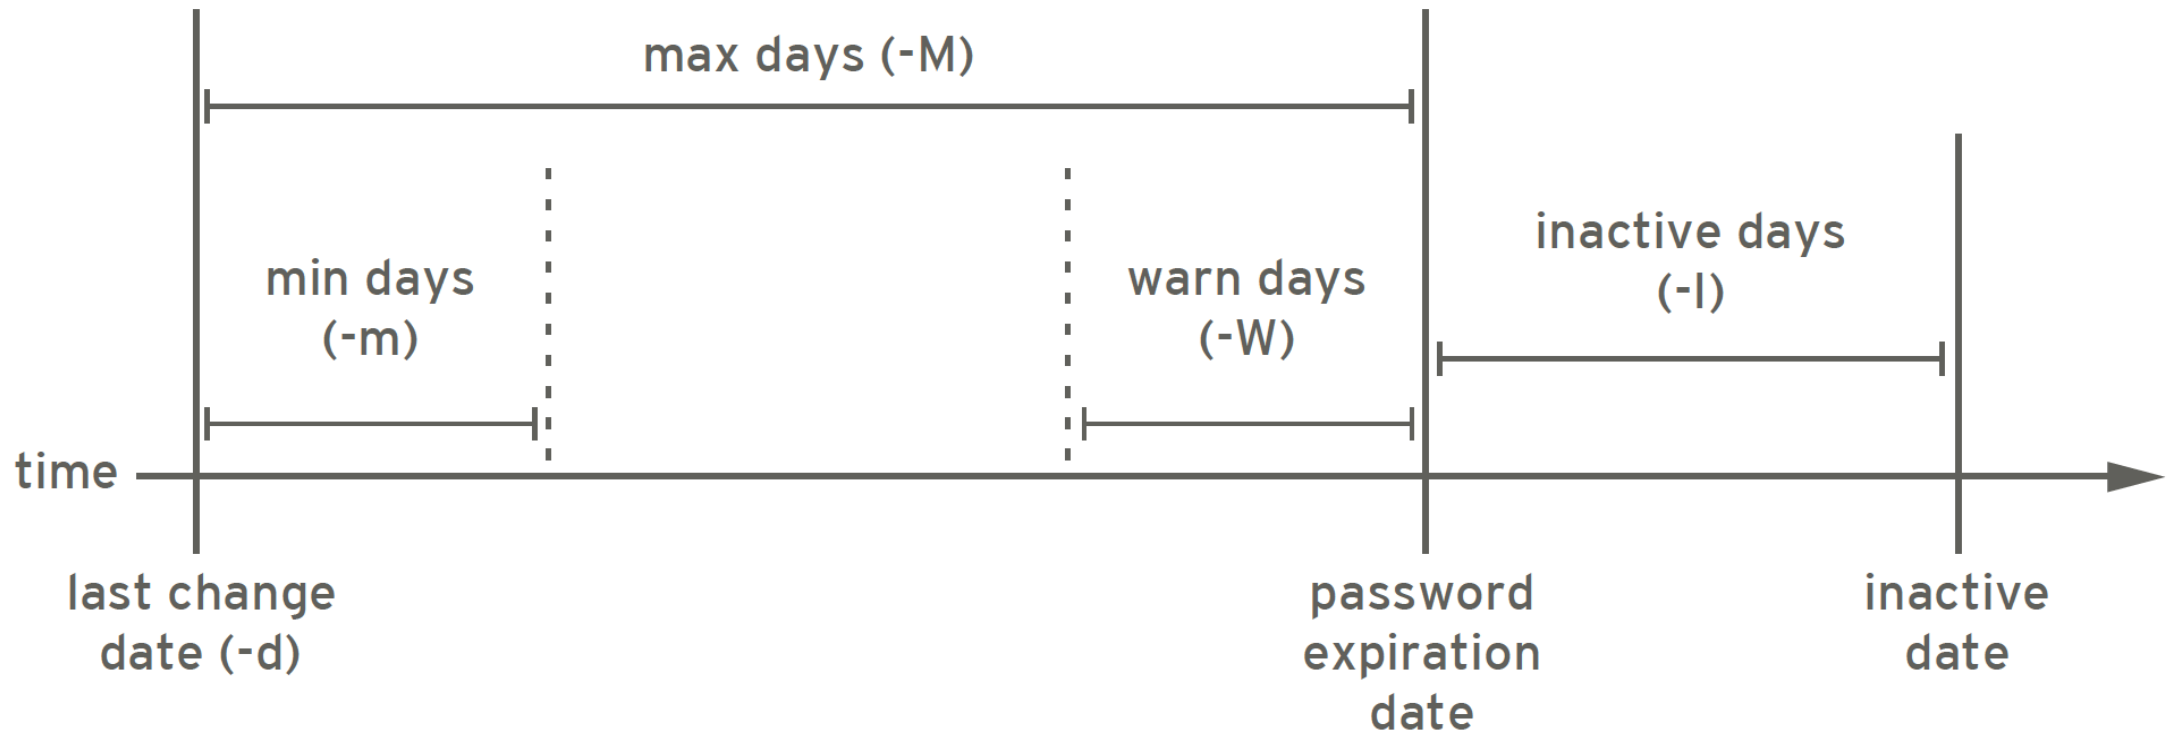

GROUP ADMINISTRATION

- ▶ **To change fields in a user's `/etc/passwd` entry you can:**
 - ▶ Edit the file by hand
 - ▶ Use **`usermod [options] username`**
- ▶ **To remove a user either:**
 - ▶ Manually remove the user from **`/etc/passwd`**, **`/etc/shadow`**, **`/etc/group`**, **`/var/spool/mail`**
- ▶ Use **`userdel [-r] username`**

MODIFYING / DELETING ACCOUNTS

- ▶ By default, passwords do not expire
- ▶ Forcing passwords to expire is part of a strong security policy
- ▶ Modify default expiration settings in `/etc/login.defs`
- ▶ To modify password aging for existing users, use the `chage` command
 - ▶ `chage [options] username`

PASSWORD AGING POLICIES

PASSWORD AGING
