

# FUNCTION

\* All the basics of the function like what is function, types of function and algebraic operations have been studied in earlier classes (means class XI to XII). Now,

## \* Kinds of Functions: -

1. One-one function (Injection) :- A function  $f: A \rightarrow B$  is said to be a one-one function or an injection if different elements of  $A$  have different images in  $B$ .

Thus,  $f: A \rightarrow B$  is one-one

$$\Leftrightarrow a \neq b \Rightarrow f(a) \neq f(b) \quad \forall a, b \in A$$
$$\Leftrightarrow f(a) = f(b) \Rightarrow a = b \quad \forall a, b \in A.$$

Eg: - If  $A = \{1, 2, 3, 4\}$ ,  $B = \{1, 2, 3, 4, 5, 6\}$  and  $f: A \rightarrow B$  be a function defined by  $f(x) = x + 2 \quad \forall x \in A$ . Is it a one-one function?

Sol<sup>n</sup>:- From Question,

$$f = \{(1, 3), (2, 4), (3, 5), (4, 6)\}.$$

Clearly different element of  $A$  has different images under function  $f$ .

So,  $f: A \rightarrow B$  is a one-one function/injection.

[Note: - Let  $f: A \rightarrow B$  and let  $x, y \in A$ . Then  $x = y \Rightarrow f(x) = f(y)$  is always true from the definition. But  $f(x) = f(y) \Rightarrow x = y$  is true only when  $f$  is one-one.]

Eg: - Find whether the following functions are one-one or not:

(a)  $f: \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^3 + 2 \quad \forall x \in \mathbb{R}$

(b)  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  given by  $f(x) = x^2 + 1 \quad \forall x \in \mathbb{Z}$

Sol<sup>n</sup>:- Let  $x, y$  be two arbitrary elements of  $\mathbb{R}$  (domain of  $f$ ) such that  $f(x) = f(y)$ , then,

(a)  $f(x) = f(y) \Rightarrow x^3 + 2 = y^3 + 2 \Rightarrow x^3 = y^3 \Rightarrow x = y$ . True.

(1)  $f(m) = f(r)$

$\Rightarrow x^2 + 1 = y^2 + 1 \Rightarrow x^2 = y^2 \Rightarrow x = \pm y$ . false

[Note: - If A and B are two sets having m and n elements respectively such that  $m \leq n$ , then total no. of one-one functions from A to B is  $n \times (n-1) \times \dots \times (n-m+1)$ .

\*2. Many-one function: - A function  $f: A \rightarrow B$  is said to be many-one function if two or more elements of set A have the same image in B.

Thus,  $f: A \rightarrow B$  is a many-one function if there exist  $x, y \in A$  such that  $x \neq y$  but  $f(x) = f(y)$ .

$\rightarrow$  In other words,  $f: A \rightarrow B$  is a many-one function if it is not a one-one function.

eg: - If  $A = \{-1, 1, -2, 2\}$ ,  $B = \{1, 4, 9, 16\}$  and  $f: A \rightarrow B$  given by  $f(x) = x^2$ . then the function is whether one-one or many-one function?

Sol<sup>n</sup>: - from question: -

$$f = \{(-1, 1), (1, 1), (-2, 4), (2, 4)\}$$

Clearly 1 and -1 have the same images. Similarly for 2. So, it is a many-one function.

eg: - Show that the function  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  defined by  $f(x) = x^2 + x \forall x \in \mathbb{Z}$ , is a many-one function.

Sol<sup>n</sup>: - Let  $x, y \in \mathbb{Z}$ . then,

$$f(x) = f(y)$$

$$\Rightarrow x^2 + x = y^2 + y$$

$$\Rightarrow (x^2 - y^2) - (x - y) = 0$$

$$\Rightarrow (x - y)(x + y - 1) = 0$$

$x = y$  or  $y = -x - 1$ .

Since  $f(x) = f(y)$  doesn't provide the unique sol<sup>n</sup>. This means  $x \neq y$ . hence,  $f$  is a many-one function.

3) Onto Function: - (Surjection): - A function  $f: A \rightarrow B$  is said to be an Onto function or a Surjection if every element of  $B$  is the  $f$  image of some element of  $A$  i.e.  $f(A) = B$  or range of  $f$  is the Co-domain of  $f$ .

→ Thus  $f: A \rightarrow B$  is a Surjection if for each  $b \in B$ , there exists  $a \in A$  such that  $f(a) = b$ .

\* Into Function: - A function  $f: A \rightarrow B$  is said to be an Into function if there exists an element in  $B$  having no pre-image in  $A$ .

→ In other words,  $f: A \rightarrow B$  is an into function if it is not an onto function.

eg:- If  $A = \{-1, 1, 2, -2\}$ ,  $B = \{1, 4\}$  and  $f: A \rightarrow B$  be a function defined by  $f(x) = x^2$ , then show that  $f$  is an onto function.

Sol<sup>n</sup>: - from Question:

$$f = \{(-1, 1), (1, 1), (2, 4), (-2, 4)\}$$

Clearly, every element of  $B$  has pre-images in  $A$ . Hence  $f: A \rightarrow B$  is an onto function.

eg:- Determine surjectivity of the following functions: -

(i)  $f: \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^3 + 2 \quad \forall x \in \mathbb{R}$

(ii)  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  given by  $f(x) = 3x + 2 \quad \forall x \in \mathbb{Z}$

(iii)  $f: \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^2 + 2 \quad \forall x \in \mathbb{R}$

Sol<sup>n</sup>: - Let  $y$  be any element of  $\mathbb{R}$ . Then,

(i)  $f(x) = y = x^3 + 2 \Rightarrow x = (y - 2)^{1/3}$

Clearly for all  $y \in \mathbb{R}$ ,  $(y - 2)^{1/3}$  is a real no.

Thus for all  $y \in \mathbb{R}$ , there exists  $x = (y - 2)^{1/3} \in \mathbb{R}$  such that  $f(x) = x^3 + 2 = y$ . Hence  $f: \mathbb{R} \rightarrow \mathbb{R}$  is an onto function.

(ii)  $f(x) = y = 3x + 2 \Rightarrow x = \frac{y - 2}{3}$ , then if  $y = 0$ ,  $x = -\frac{2}{3} \notin \mathbb{Z}$

∴  $f$  is not an onto function.

$f(x) = x^2 + 2$ . Clearly  $x^2 + 2 \geq 2$  so, negative real no. in  $\mathbb{R}$  (domain) do not have pre-images in  $\mathbb{R}$ . Hence  $f$  is not an onto function.

4) One-One Onto Function: - (Bijection): -

A function  $f: A \rightarrow B$  is a bijection if it is one-one as well as onto.

In other words, a function  $f: A \rightarrow B$  is a bijection, if

(1) it is one-one i.e.  $f(x) = f(y) \Rightarrow x = y \quad \forall x, y \in A$ .

(2) it is onto i.e.  $\forall y \in B$ , there exists  $x \in A$  such that  $f(x) = y$ .

eg:- Prove that the function  $f: \mathbb{Q} \rightarrow \mathbb{Q}$  given by  $f(x) = 2x - 3 \quad \forall x \in \mathbb{Q}$  is a bijection.

Sol<sup>n</sup>:- Let  $x, y$  be two arbitrary elements in  $\mathbb{Q}$ . then,

$$f(x) = f(y) \Rightarrow 2x - 3 = 2y - 3 \Rightarrow x = y.$$

Thus  $f(x) = f(y) \Rightarrow x = y \quad \forall x, y \in \mathbb{Q}$

So,  $f$  is an injection.

Now let  $y$  be any arbitrary element of  $\mathbb{Q}$ . then,

$$f(x) = y = 2x - 3 \Rightarrow x = \frac{y+3}{2}$$

clearly for all  $y \in \mathbb{Q}$ ,  $x = \frac{y+3}{2} \in \mathbb{Q}$ .

$\therefore f$  is a surjection.

hence  $f: \mathbb{Q} \rightarrow \mathbb{Q}$  is a bijection.

eg:- Let  $A = \{x \in \mathbb{R}, -1 \leq x \leq 1\} = B$  show that  $f: A \rightarrow B$  given by

$f(x) = x/|x|$  is a bijection.

Sol<sup>n</sup>:- Let  $x, y$  be two arbitrary elements in  $A$ , then

$$x \neq y \Rightarrow x/|x| \neq y/|y| \Rightarrow f(x) \neq f(y)$$

So  $f$  is an injective map.

Surjectivity:-

we have,  $f(x) = x/|x| = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$

for  $0 \leq x \leq 1$   
 $f(x) = x^2$   
 and for  $-1 \leq x < 0$   
 $f(x) = -x^2$   
 for every value of  $y$ , there is a pre-image in  $A$ . hence  $f$  is a bijection.

[Note: - It follows from the above discussion that if  $A$  and  $B$  are two finite sets and  $f: A \rightarrow B$  is a function, then

(i)  $f$  is an injection  $\Rightarrow n(A) \leq n(B)$

(ii)  $f$  is a surjection  $\Rightarrow n(A) \geq n(B)$

(iii)  $f$  is a bijection  $\Rightarrow n(A) = n(B)$ .

### \* Composition of functions: -

Let  $f: A \rightarrow B$  and  $g: B \rightarrow C$  be two functions. Then a function  $g \circ f: A \rightarrow C$  defined by

$(g \circ f)(x) = g(f(x))$ ,  $\forall x \in A$  is called the composition of  $f$  and  $g$ .

### Conditions: -

- It is evident from the definition that  $g \circ f$  is defined only if for every  $x \in A$ ,  $f(x)$  is an element of  $B$  so that we can take its  $g$ -image. Hence for the composition  $g \circ f$  to exist, the range of  $f$  must be a subset of the domain of  $g$ .
- Similarly,  $f \circ g$  exists if range of  $g$  is a subset of domain of  $f$ .

### \* Properties of Composition of functions: -

1. The composition of functions is not commutative i.e.  $f \circ g \neq g \circ f$ .

2. The composition of function is associative i.e. if  $f, g, h$  are three functions such that  $(f \circ g) \circ h$  and  $f \circ (g \circ h)$  exist, then

Proof: -  
 $f: A \rightarrow B$  ;  $g: B \rightarrow C$  ;  $h: C \rightarrow D$        $(f \circ g) \circ h = f \circ (g \circ h)$   
 $f: A \rightarrow B$  ;  $g: B \rightarrow C$  ;  $h: C \rightarrow D$        $(f \circ g) \circ h: A \rightarrow D$        $f \circ (g \circ h): A \rightarrow D$

3. The composition of two ~~functions~~ bijections is a bijection i.e. if  $f$  and  $g$  are two bijections, then  $g \circ f$  is also a bijection.

4) Let  $f: A \rightarrow B$ . Then  $f \circ I_A = I_B \circ f = f$  i.e. the composition of any function with the identity function is the function itself. (6)

5) Let  $f: A \rightarrow B$ ,  $g: B \rightarrow A$  be two functions such that  $g \circ f = I_A$ . Then,  $f$  is an injection and  $g$  is a surjection.

6) Let  $f: A \rightarrow B$ ,  $g: B \rightarrow A$  be two functions such that  $f \circ g = I_B$ . Then  $f$  is a surjection and  $g$  is an injection.

7) Let  $f: A \rightarrow B$  and  $g: B \rightarrow C$  be two functions. Then,  
 (i)  $g \circ f: A \rightarrow C$  is onto  $\Rightarrow g: B \rightarrow C$  is onto

(ii)  $g \circ f: A \rightarrow C$  is one-one  $\Rightarrow f: A \rightarrow B$  is one-one

(iii)  $g \circ f: A \rightarrow C$  is onto and  $g: B \rightarrow C$  is one-one  $\Rightarrow f: A \rightarrow B$  is onto.

(iv)  $g \circ f: A \rightarrow C$  is one-one and  $f: A \rightarrow B$  is onto  $\Rightarrow g: B \rightarrow C$  is one-one.

### \* Composition of Real functions:-

Let  $f: D_1 \rightarrow R$  and  $g: D_2 \rightarrow R$  be two real functions. Then,

$$g \circ f: X = \{x \in D_1 : f(x) \in D_2\} \rightarrow R$$

and,

$$f \circ g: Y = \{y \in D_2 : g(y) \in D_1\} \rightarrow R$$

are defined as

$$g \circ f(x) = g(f(x)) \quad \forall x \in X \quad \text{and} \quad f \circ g(y) = f(g(y)) \quad \forall y \in Y.$$

[Note:- (i) If  $\text{Range}(f) \subseteq \text{Domain}(g)$ , then  $g \circ f: D_1 \rightarrow R$  and if  $\text{Range}(g) \subseteq \text{Domain}(f)$ , then  $f \circ g: D_2 \rightarrow R$

(ii) For any two real functions  $f$  and  $g$ , it may be possible that  $g \circ f$  exists but  $f \circ g$  does not. In some cases, even if both exist,  $f \circ g$  may not be equal.

(iii) If  $\text{Range}(f) \cap \text{Domain}(g) = \emptyset$ , then  $g \circ f$  doesn't exist. In other words  $g \circ f$  exists if  $\text{Range}(f) \cap \text{Domain}(g) \neq \emptyset$ .

(iv) If  $f$  and  $g$  are bijection, then  $f \circ g$  and  $g \circ f$  both are bijections.

(v) If  $f: R \rightarrow R$  and  $g: R \rightarrow R$  be two real functions, then  $f \circ g$  and  $g \circ f$  both exist.

(vi) If  $f: R \rightarrow R$  and  $g: R \rightarrow R$  be two real functions, then  $f \circ g$  and  $g \circ f$  both exist.

\* Inverse of an element: -

Let A and B be two sets and  $f: A \rightarrow B$  be a mapping.

then if  $a \in A$  and  $b \in B$ .

$f(a) = b$  and  $f^{-1}(b) = a$ .

→ The inverse of an element under a function may consist of single/more element, it all depend on what type of function is given:

- if it is one-one → inverse will have single
- " " many-one → " " many
- " " onto → " " single/may
- " " into → " " No/single/may.

eg:-

$f^{-1}(b_3) = \{a_1, a_2\}$   
 $f^{-1}(b_4) = \{a_3\}$   
 $f^{-1}(b_1) = \phi$

Similarly all.

\* Inverse of a function: -

Let  $f: A \rightarrow B$  be a bijection. Then a function  $f^{-1}: B \rightarrow A$  which associates each element  $y \in B$  to a unique element  $x \in A$  such that  $f(x) = y$  is called the inverse of 'f'.

$f(x) = y \iff f^{-1}(y) = x$ .

The inverse of 'f' is generally denoted by  $f^{-1}$ .

Thus, if  $f: A \rightarrow B$  is a bijection, then  $f^{-1}: B \rightarrow A$  is such that

$f(x) = y \iff f^{-1}(y) = x$

eg:- Let  $f: R \rightarrow R$  be defined by  $f(x) = 3x - 7$ . Show that 'f' is invertible and hence  $f^{-1}$ .

Ans:- Injection:- Let  $x, y \in R$ , then,

$f(x) = f(y)$   
 $\implies 3x - 7 = 3y - 7$   
 $\therefore x = y$  True

Surjection:- Let  $y$  be any arbitrary element of  $R$ , then,

$y = 3x - 7 \implies x = \frac{y+7}{3} \in R$

Now, Let  $f(x) = y$ . True,  $\forall y \in R$   
 $y = 3x - 7$   
 $\implies x = \frac{y+7}{3} \therefore f^{-1}(y) = \frac{y+7}{3} \quad f^{-1}: R \rightarrow R$

\* Properties of Inverse of a function: -

- 1.) The Inverse of a bijection is unique.
- 2.) The Inverse of a bijection is also a bijection.
- 3.) If  $f: A \rightarrow B$  is a bijection and  $g: B \rightarrow A$  is the inverse of  $f$ , then  $f \circ g = I_B$  and  $g \circ f = I_A$ , where  $I_A$  and  $I_B$  are the identity functions on the set  $A$  and  $B$  respectively.
- 4.) If  $f: A \rightarrow B$  and  $g: B \rightarrow C$  are two bijections, then  $g \circ f: A \rightarrow C$  is a bijection and  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ .
- 5.) Let  $f: A \rightarrow B$  and  $g: B \rightarrow A$  be two functions such that  $g \circ f = I_A$  and  $f \circ g = I_B$ . Then  $f$  and  $g$  are bijection and  $g = f^{-1}$ .
- 6.) Let  $f: A \rightarrow B$  be an invertible function. ~~Show that~~ the inverse of  $f^{-1}$  is  $f$ ; i.e.  $(f^{-1})^{-1} = f$ .
- 7.) Sometime  $f: A \rightarrow B$  is one-one but not onto. In such a case  $f^{-1}$  is not invertible. But,  $f: A \rightarrow \text{Range}(f)$  is both one-one and onto. ~~So~~, it is invertible and its inverse can be found.

eg:-
