Power & Energy Society

Jornada técnica en subestaciones

Gas Insulated Switchgear & Transmission Lines

Hermann Koch IEEE Fellow – Siemens

Febrero 20 HMV Ingenieros, Medellin, 8 am – 5pm

IEEE/PES Substation Committee- GIS Subcommittee

Agenda

Part 1

- 08:30 Introduction & Theory**
- 08:45 Design & Manufacturing**
- 09:00 Testing, Operation & Maintenance**
- 09:15 Interface to GIS**
- 09:30 Control and Monitoring**
- 09:45 Installation & Commissioning**
- 10:15 Coffee Break**

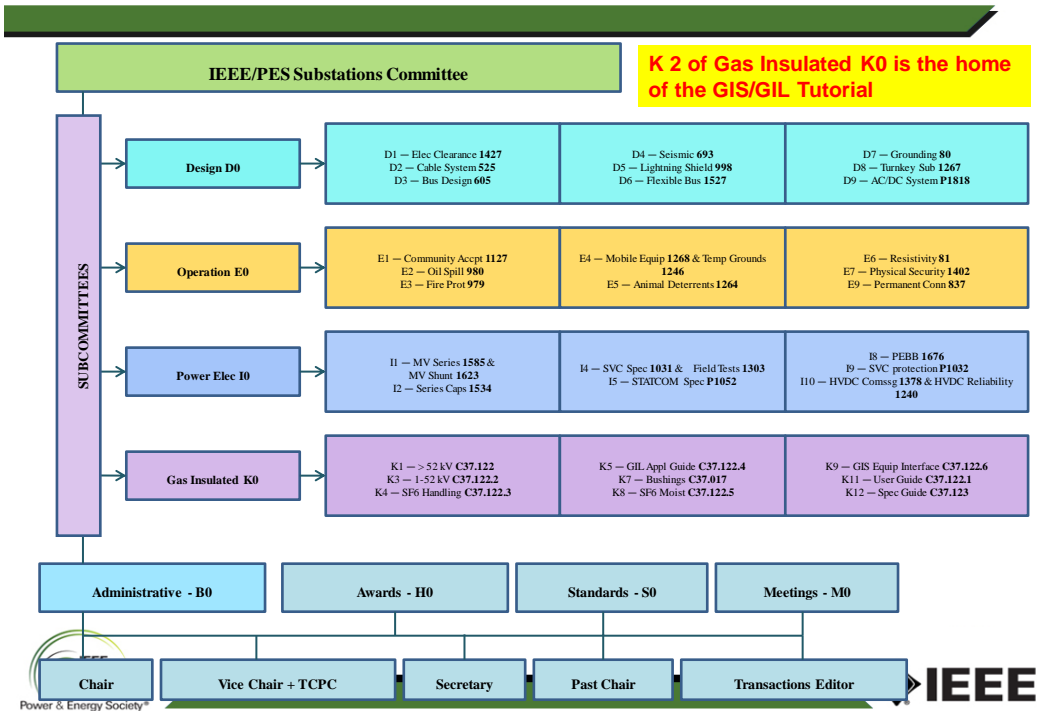

Part 2

- 13:00 GIS Applications**
- 13:20 Life Cycle Cost**
- 13:40 Compare AIS and GIS**
- 14:00 Mobile GIS**
- 14:20 GIS Specification**
- 14:40 GIL**
- 15:00 Future Development of HV GIS**
- 15:45 Coffee Break**

IEEE/PES Substation Committee- GIS Subcommittee

K2 Gas Insulated Technology Tutorial / Panel Active Members

Name	Affiliation	Time
George Becker	POWER Engineers	since 2002
Arnaud Ficheux	GE Grid Solutions	since 2008
John Brunke	POWER Engineers	since 2005
Mark Etter	ABB	since 2002
Pat Fitzgerald	AZZ CGIT	since 2006
Hermann Koch	Siemens	since 2002
Ryan Stone	Mitsubishi	since 2006
Peter Grossmann	Siemens	since 2008
Dave Solhtalab	PG&E	since 2010
Richard Jones	EnEngineering/SES	since 2002
Pravakar Samanta	ABB	since 2014

IEC GIS-GIL References Standards

IEC 62271-3:2015	High-voltage switchgear and controlgear - Part 3: Digital interfaces based on IEC 61850
IEC 62271-200:2011	High-voltage switchgear and controlgear - Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV
IEC 62271-201:2014	High-voltage switchgear and controlgear - Part 201: AC solid-insulation enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV
IEC 62271-202:2014	High-voltage switchgear and controlgear - Part 202: High-voltage/ low-voltage prefabricated substation
IEC 62271-203:2011	High-voltage switchgear and controlgear - Part 203: Gas-insulated metal-enclosed switchgear for rated voltages above 52 kV
IEC 62271-204:2011	High-voltage switchgear and controlgear - Part 204: Rigid gas-insulated transmission lines for rated voltage above 52 kV
IEC 62271-205:2008	High-voltage switchgear and controlgear - Part 205: Compact switchgear assemblies for rated voltages above 52 kV
IEC 62271-206:2011	High-voltage switchgear and controlgear - Part 206: Voltage presence indicating systems for rated voltages above 1 kV and up to and including 52 kV

IEC GIS-GIL References Standards

IEC 62271-207:2012	High-voltage switchgear and controlgear - Part 207: Seismic qualification for gas-insulated switchgear assemblies for rated voltages above 52 kV
IEC TR 62271-208:2009	High-voltage switchgear and controlgear - Part 208: Methods to quantify the steady state, power-frequency electromagnetic fields generated by HV switchgear assemblies and HV/LV prefabricated substations
IEC 62271-209:2007	High-voltage switchgear and controlgear - Part 209: Cable connections for gas-insulated metal-enclosed switchgear for rated voltages above 52 kV - Fluid-filled and extruded insulation cables - Fluid-filled and dry-type cable-terminations
IEC TS 62271-210:2013	High-voltage switchgear and controlgear - Part 210: Seismic qualification for metal enclosed and solid-insulation enclosed switchgear and controlgear assemblies for rated voltages above 1 kV and up to and including 52 kV
IEC 62271-211:2014	High-voltage switchgear and controlgear - Part 211: Direct connection between power transformers and gas-insulated metal-enclosed switchgear for rated voltages above 52 kV
IEC TS 62271-304:2008	High-voltage switchgear and controlgear - Part 304: Design classes for indoor enclosed switchgear and controlgear for rated voltages above 1 kV up to and including 52 kV to be used in severe climatic conditions

GIS Basic Ratings of GIS

according to IEEE C37.122 and IEC 62271-203

Rated Maximum High Voltages	(U_m) [kV]	66-72,5-100-123-145-170-245 300-362-420-550-800-1100
Rated Insulation Levels	(U_p) [kV]	140-185-230-325-375-425 460-500-650-740-900-1200
IEEE Rated Lightning Impulse Withstand Voltage Levels	(U_p) [kV]	325-450-550-650-750-1050-1175- 1425-1550-2100
Rated Currents	(I_R) [A]	up to 170 kV: 1250 A-3150 A above 170 kV: 3150 A-8000 A
Short Time Withstand Current	(I_C) [kA]	up to 170 kV: 16 kA-50 kA above 170 kV: 31,5 kA-100 kA
Rated Supply Voltage	(V)	DC: 48 V, 110 V, 125 V AC: 208/130 V, 400/230 V, 230/115 V

Content

Part 1

- Theory
- SF₆ Insulating Gas

Sulfur Hexafluoride SF₆

- A man-made colorless, odorless, stable gas
- A large octahedral non-polar molecule
- Collision Diameter
 - N₂ 16.1 A
 - SF₆ 36.5 A
- Molecular weight 146.05 (about 5 times the weight of air)
- SF₆ is broken down by heat and arcs
 - SF₆ bi-products largely reform into SF₆
- Ionization potential of Nitrogen 15.6 eV
- Ionization potential of SF₆ 15.6 eV
- Pictured: SF₆ and N₂

Physics Review

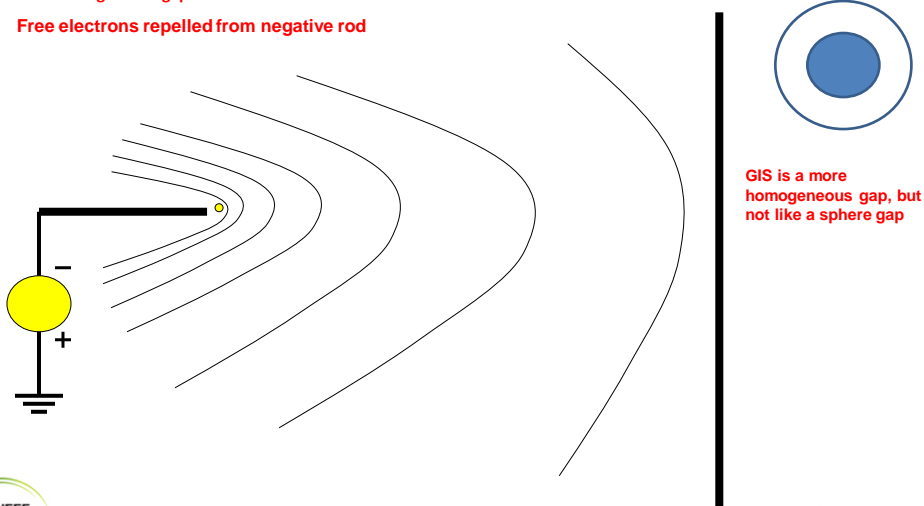

- Ionization, the process of removing an electron from an atom or molecule
- Excitation, the condition in which an electron moves to a higher, unstable energy level. Relaxation results in the electron returning to a stable energy level, releasing the excess energy as a photon
- Free electrons
 - From ionization by cosmic rays, photons, friction, chemical reactions, thermal, etc.
- Mean free path
 - Mean distance before a molecule or electron will impact another molecule
- Mean Free Path
 - N_2 $6 \times 10^{-8} \text{ m}$
 - SF_6 $2.5 \times 10^{-8} \text{ m}$

GIS Theory

Non-homogeneous gap

Free electrons repelled from negative rod

Ions Vs Electrons

Ion Mobility

- Mass ratio of an electron vs. mass of SF₆ 1 to 125,000 (1500 lbs. vs 95,000 tons)

IEEE/PES Substation Committee- GIS Subcommittee

GIS Theory
Electron Avalanche by electron Impact

IEEE/PES Substation Committee- GIS Subcommittee

GIS Theory

Many Collisions Produce Photons and Photo Ionizations

On a macro level if enough space charge is created the electric field is modified

On a micro level the avalanche continues

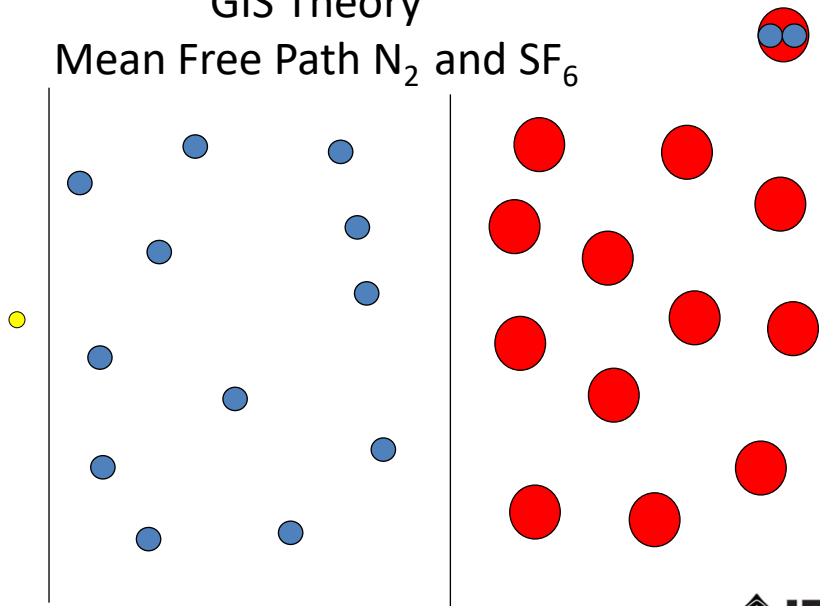

IEEE/PES Substation Committee- GIS Subcommittee

GIS Theory

Mean Free Path N_2 and SF_6

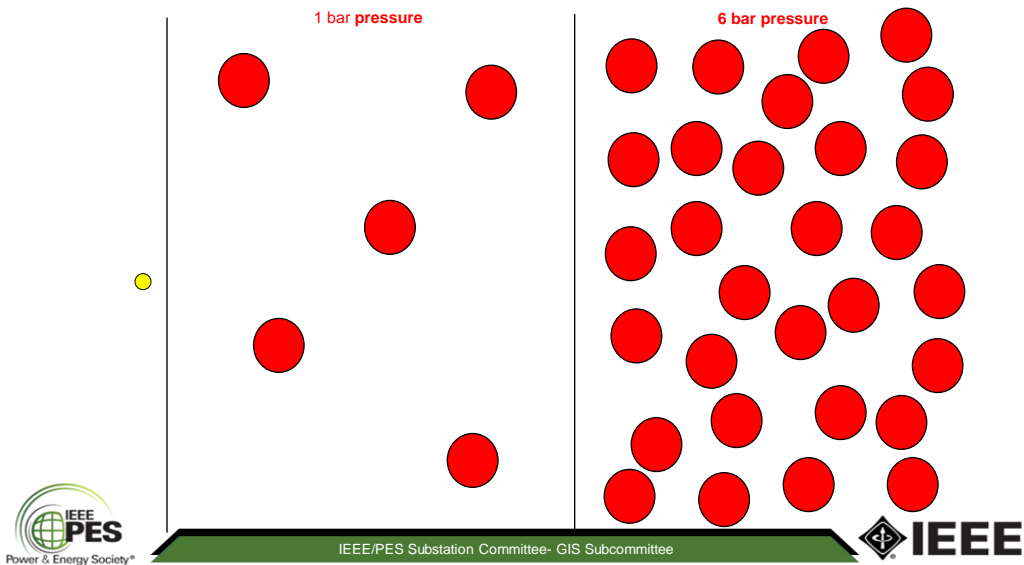

IEEE/PES Substation Committee- GIS Subcommittee

GIS Theory

Impact of Increasing the Gas Density 6x

GIS Theory

Electron Affinity

- **Electro-negative**
 - Electron Affinity (strong affinity for electron attachment)
 - Free electrons are often captured
- **Mechanisms**
 - Resonance capture $e + SF_6 \rightarrow SF_6^-$
 - Dissociative attachment $e + SF_6 \rightarrow SF_5^- + F$
 - Energy requirements are low (0.1 eV or less)

GIS Theory

Summary, why is SF6 a Good Insulating Gas?

- Molecule is large
 - Electron Affinity
 - Fairly high ionization potential
- The breakdown strength of air is dramatically increased by the addition of small quantities of SF₆. In contrast, air has only a limited influence on the breakdown strength of sulfur hexafluoride. The addition of 10 % of air by volume reduces the breakdown voltage of SF₆ by about 3 %, the addition of 30 % air by about 10 %.

- Design
- Modular Structure

IEEE/PES Substation Committee- GIS Subcommittee

Three phase enclosure GIS (145 kV)

IEEE/PES Substation Committee- GIS Subcommittee

Single phase enclosure (>245 kV)

IEEE/PES Substation Committee- GIS Subcommittee

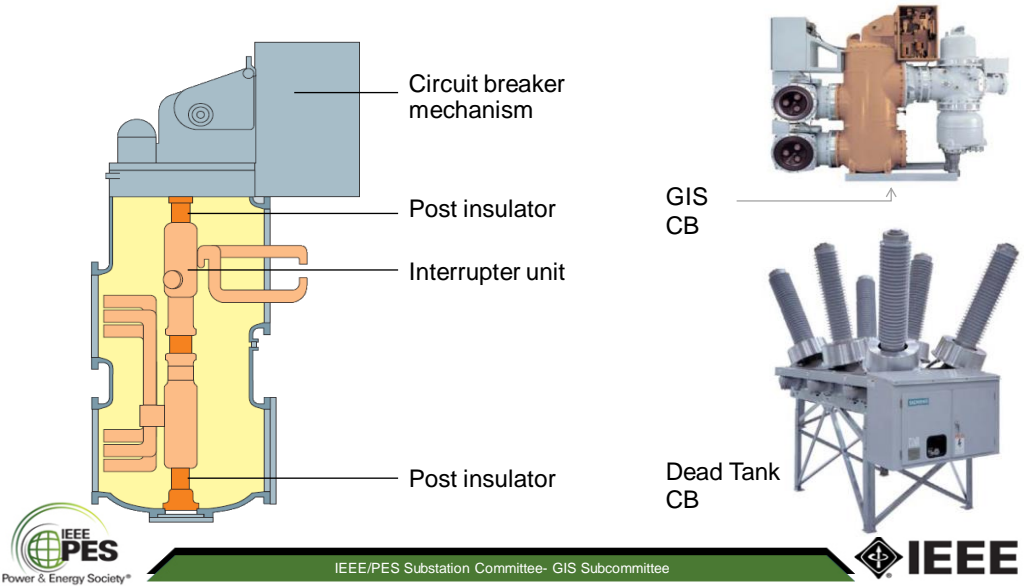

Modular Structure (schematic)

IEEE/PES Substation Committee- GIS Subcommittee

Circuit Breaker Module

Disconnecter/ Ground Switch Module

Current Transformer

IEEE/PES Substation Committee- GIS Subcommittee

Voltage Transformer

IEEE/PES Substation Committee- GIS Subcommittee

Outdoor Termination

IEEE/PES Substation Committee- GIS Subcommittee

Transformer Termination

IEEE/PES Substation Committee- GIS Subcommittee

Cable Termination

IEEE/PES Substation Committee- GIS Subcommittee

Surge Arrestor

IEEE/PES Substation Committee- GIS Subcommittee

Sealing Systems

O-rings and sealants to provide gas tight systems

The leakage rate from any single gas compartment to the atmosphere shall not exceed 0.5 % per year.*
Practical experiences to the today's design of GIS show leakage rates as low as 0.1 % per year per gas compartment.

* IEEE Std C37.122 – 2010, IEEE Standard for High Voltage Gas- Insulated Substations Rated Above 52 kV

closed position through
a view port camera**

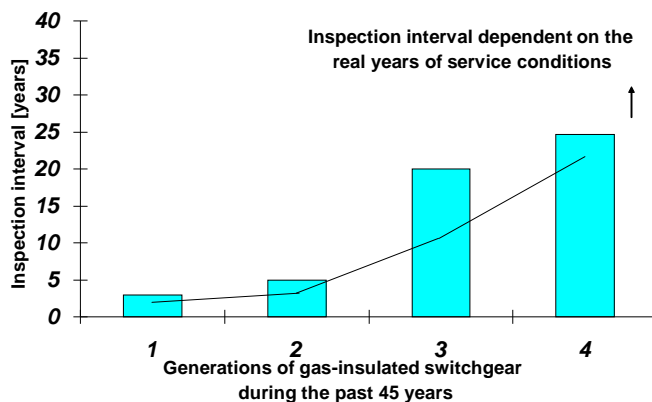

Maintenance/Inspections

- Time Based Intervals
- Load Depended Intervals
- Condition Monitoring Based Intervals

Maintenance

Progress of Maintenance/Inspection Activities

IEEE/PES Substation Committee- GIS Subcommittee

Condition-Based Maintenance

- Routine Inspection
 - External visual inspection of the GIS installation
 - Status of gas density monitors
 - Condition of gas seals and operating mechanisms
 - Integrity of ground and other connections
 - Number of operations
 - In intervals of two to five times a month, depending on operating conditions.
- Condition-Based Maintenance
 - Only required after an internal fault or if maximum number of operations has been exceeded.
 - Both are extremely rare!

IEEE/PES Substation Committee- GIS Subcommittee

Content Part 1

- Control
 - Indications
 - Alarms
 - Operating controls
 - Interlocking/ Blocking

Control Local Control Cubicle (LCC)

Digital bay
controller

Hardwire with
electromechanical
relays

Control - Alarms

Typical alarms:

- Supply power CB open
- CB spring charge time exceeded
- CB spring discharged
- CB trip coil failed
- Operating time of switch exceeded
- Switch not in end position(abnormal position alarm)
- Voltage Transformer secondary fuse or CB open
- Gas under/over pressure alarms
- Gas monitoring plug disconnected
- Bay controller status(healthy, out of service, in programming mode, etc.)

Content Part 1

- Monitoring
 - SF6 Gas Density Monitoring
 - Circuit Breaker Condition Monitoring
 - Partial Discharge (PD) Monitoring
 - Arc Location Monitoring
 - Surge Arrester Monitoring
 - High Voltage Detection System (HVDS)

SF6 Gas Density Monitoring

A typical GIS bay's gas zones are shown. Some gas zones are more critical than others; for instance a certain gas pressure/ density is critical for correct operation of the circuit breaker.

IEEE/PES Substation Committee- GIS Subcommittee

SF6 Gas Monitoring – Pressure Monitoring

The simplest way to monitor density is to measure pressure with a simple pressure switch and make a conversion using a chart. Inherent issue with this method is that pressure changes with temperature and for environments where there are large fluctuations in temperature, the measurements can be inaccurate. Pressure monitoring in these cases may also lead to false alarms and incorrect interlocking functions. The newer versions of the pressure monitors have a temperature compensation function eliminate some of these issues.

IEEE/PES Substation Committee- GIS Subcommittee

Content

Part 1

Installation and Commissioning

A Preparation

B Installation steps

C Commissioning and on-site testing

IEEE/PES Substation Committee- GIS Subcommittee

Preparation

Requirements:

EHS instructions

Qualified people

Clean environment

Drawings and diagrams

Tools and materials on-site

IEEE/PES Substation Committee- GIS Subcommittee

Installation steps - aligning the GIS

Check for clean floor and that components are damage free

Determine longitudinal and lateral axes

Mark GIS set up points

Assemble GIS bay by bay

IEEE/PES Substation Committee- GIS Subcommittee

Installation steps - flange treatment

Insulators are not damaged

Flanges are scratch free

Cleanliness matters!

IEEE/PES Substation Committee- GIS Subcommittee

Commissioning and on-site testing

High voltage impulse testing

Voltage divider

Impulse generator

Lightning impulse test
additional to power
frequency test for > 245
kV GIS

Alternative if no partial
discharge measurement
possible

Detects peaks on
conductors and loose
particles

Content

Part 2

- **Specification**
- **Documentation**

IEEE/PES Substation Committee- GIS Subcommittee

Major Specification Content Areas

- Detailed One-Line Diagram
- General Arrangement of Equipment
- Primary Equipment Data and Ratings
- Gas Zone Configuration
- Secondary Equipment Data
- Engineering Studies
- Logistics Studies
- Test and Inspections
- Standards and Regulations
- Project Deliverables
- Other Project Specific Requirements to Consider

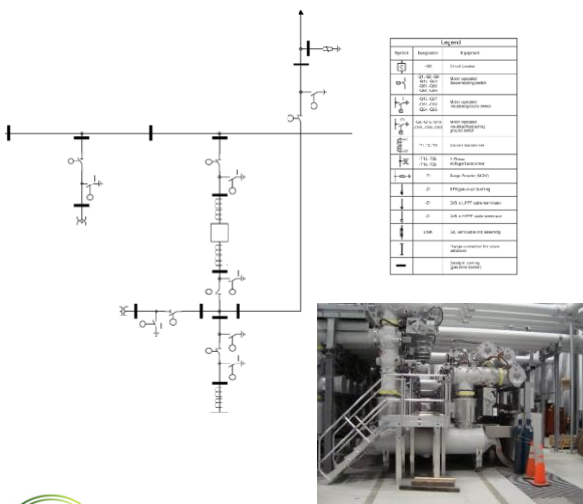

Detailed information and check lists for the specification of GIS can be found in IEEE C37.123 Annex A

IEEE/PES Substation Committee- GIS Subcommittee

Detailed One Line Diagram

One-line should show the following equipment:

- High Voltage Circuit Breakers
- Current Transformers
- Primary Disconnect Switches with Operator Type
- High Speed Ground Switches with Operator Type
- Grounding Switches with Operator Type
- Voltage Transformers
- Main Buses and Lines
- Terminal Interfaces (i.e. Cable terminations, SF6 Gas-to-Air Bushings etc.)
- Gas Barrier Insulators
- Surge Arresters
- Removable Bus Links

One-line should be drawn in a semi-physical orientation

IEEE/PES Substation Committee- GIS Subcommittee

General Arrangement of Equipment

- Prefabricated, factory assembled, tested, and shipped in the largest practical assemblies
- Sufficient space and access areas for ready removal and reinstallation of each component
- **Optimized arrangements** to reduce installation time, provide ease of operation, minimize maintenance and repair costs, and facilitate future additions
- All gauges, viewports, and gas fill points readily accessible and viewable by maintenance personnel
- Give **special attention** to the connections between the GIS and other components of the network **overhead lines, transformers, cables** etc. can have **major impact on the overall layout and cost**

IEEE/PES Substation Committee- GIS Subcommittee

Primary Equipment Data and Ratings

Circuit Breakers	
Rated maximum voltage	XXX kV for circuit breakers defined as "definite purpose" for fast transient recovery voltage rise times" per ANSI/IEEE C37.06.1, OR XXX kV for "general purpose" per ANSI/IEEE C37.06
Rated maximum interrupting time	X cycles on a 60 Hz basis
Rated minimum current, all breakers	X,XXX A
Rated short-circuit breaking current	XX kA CR
Rated closing and latching current	XXX kA peak
Rated operating sequence	Daily Cycle: CR-1-CO-12-CO where t1 = 0.3 seconds, and t2 = 3 minutes
Rated capacitive switching currents	IEC 62056 Table 5
Number of mechanical operations	10,000 (minimum)
Number of trip coils	X
TRV, and time to peak @T100	XXX kV, XXX microseconds
TRV, and time to peak @T60	XXX kV, XXX microseconds
TRV, and time to peak @T30	XXX kV, XXX microseconds
TRV, and time to peak @T10	XXX kV, XXX microseconds
Closing resistor (if required), resistance and insertion time	X ohm, XX microseconds
Disconnect switches	
Rated minimum current, all disconnect switches	X,XXX A
Rated short-time withstand current	XX kA
Rated peak withstand current	XXX kA
Rated duration of short circuit	1 second
Mechanical endurance	1,000 cycles (minimum)
Grounding switches	
Rated minimum current, all grounding switches	X,XXX A
Rated short-time withstand current	XX kA
Rated peak withstand current	XXX kA

- General Criteria
- GIS Equipment Ratings and Service Conditions
- Enclosure Design - Single Phase or Three Phase
- Specific Equipment Requirements
- Circuit Breakers
- Disconnect Switches, Grounding Switches and Operators
- Gas System and Gas Zone Configurations
- Current Transformers
- Inductive Voltage Transformers
- Metal-Enclosed Surge Arresters
- SF6 Gas-to-Air Bushings
- GIS to Cable Connections
- GIS to GIB/GIL Connections
- Power Transformer Bushing Connections
- Local Control Cabinets and Marshaling Cabinets
- Ladders, Platforms, Stairs, and Walkways

IEEE/PES Substation Committee- GIS Subcommittee

Primary Equipment Data and Ratings

- The manufacturer should provide a **breakdown of the primary equipment specifications** in the preliminary engineering budgetary proposal and the final proposal
- The manufacturer should provide a **full set of ratings** for the primary equipment
- The manufacturer should provide complete fill-in data on all specified components
- The user and manufacturer should **meet to reconcile all user requirements** with the manufacturer's proposed design

Disconnect Switch Example

	User Requirements	Supplier Proposal
Rated full-wave impulse withstand voltage		
Across the open gap (kV Peak)		
Power frequency - one (1) minute withstand voltage:		
Across the open gap (kV rms)		
Number of open-close operations before inspection or servicing		
Maximum control voltage (VDC)		
Minimum control voltage (VDC)		
Motor Current, start/run (A)		
Rated peak withstand current (kA rms)		
Short term withstand current (kA rms)		
Maximum opening current (A) at rated voltage		
Maximum dosing current (A)		
Heater power per three (3) pole switch (W)		
Main current carrying contact material		
Base material and specification		
Contact insert material		
Plating material		
Control data for operating mechanism		
Operating time (s)		

IEEE/PES Substation Committee- GIS Subcommittee

Gas Zone Configuration

- Ability to **calibrate density monitors** without de-energizing the equipment
- 3-in-1 enclosure = three-phase gas pressure and density monitoring; single-phase enclosure = single-phase gas pressure and density monitoring
- Leakage rate of SF6 gas** from any individual gas compartment and total leakage from GIS system not to exceed **0.1 percent per year**
- Connections for a gas density relay/monitoring system, gas handling equipment, moisture detection instrumentation and fittings to **permit the addition of SF6 gas while GIS components are in service (energized)**
- Each gas zone with a switching should be furnished with a gas density monitoring device
 - First alarm - Low gas density (nominally 5-10 percent below nominal fill density) to local annunciator and to user's SCADA RTU
 - Second alarm - Trip circuit breakers associated with the affected gas zone before minimum gas density to achieve equipment ratings is reached and block closing of circuit breakers associated with the affected gas zone

IEEE/PES Substation Committee- GIS Subcommittee

Gas Zone Configuration

IEEE/PES Substation Committee- GIS Subcommittee

Circuit Breakers

- Designed in the same manner as dead tank SF₆ puffer and arc assist circuit breakers that are used in air insulated substations
- **All gauges, counters, and position indicators should be readable by an operator standing near the equipment at floor level**
- Provide for **onboard condition monitoring systems** and transducers to monitor:
 - Timing
 - Travel
 - Mechanism pressure
 - Trip and close currents
 - Auxiliary DC supply voltage
 - AC phase currents and voltages
 - Auxiliary switch positions
 - Circuit breaker bay temperature
 - SF₆ gas density and pressure
 - Cumulative I²t calculation
- Mechanism charging motor to be a **universal AC/DC motor, field selectable**

IEEE/PES Substation Committee- GIS Subcommittee

Disconnect Switches, Grounding Switches and Operators

- Disconnect switches and grounding switches, gang and motor-operated, non-load break, with one operating mechanism per three-pole switch
- Provisions for **bypassing electrical interlocking scheme** between the disconnect switch and the grounding switch to **facilitate voltage and current testing of the internal parts of the GIS without removing SF6 gas or opening the enclosure**
- **Viewports accessible from the floor by personnel**
- If not then dedicated optical cameras at each viewport with viewing monitor and cabling system
- Furnish **maintenance platforms, ladders, and/or stairs to access all of the viewports**

IEEE/PES Substation Committee- GIS Subcommittee

Current/Voltage Transformers

Inductive Current Transformers

- Current transformer secondaries terminated to six-point shorting terminal blocks in the Local Control Cabinets
- Each **current transformer able to be tested without the removal of gas**

Inductive Voltage Transformers

- Inductive voltage transformers to have an **electric field shield between the primary and secondary windings** to prevent capacitive coupling of any transient voltages
- Voltage transformers **fabricated to mitigate the possibility of ferroresonance** during operation, with provisions for damping equipment

IEEE/PES Substation Committee- GIS Subcommittee

Metal Enclosed Surge Arrester / Bushings

SF6 Gas to Air Bushings

- Provide surge arresters to protect underground cables connected to the GIS from impulse surges
- **Arresters connected to the SF6 cable sealing end at the junction of the cable connection**
- Insulation coordination studies to ensure proper surge arrester application

SF6 Gas to Air Bushings

- Internal **metal shields** installed in the bushing cylinder to **control electric field distribution**
- Each gas-to-air bushing to have its own **gas zone and gas density monitoring transducers**, transducers **accessible from the ground using a step ladder or improvised platform**

IEEE/PES Substation Committee- GIS Subcommittee

Cable Sealing End Terminations / Transformer Terminations

Cable Sealing End Terminations

- Removable link or plug in connector that allows current transfer from the cable conductor to the GIS conductor, so that it can be disconnected from the GIS when testing is performed on either the GIS or the cable
- **MOV arresters across cable to sealing end interface**

Transformer Terminations

- **Appropriate grounding connections across the flanges** of the transformer termination module
- **Expansion joints** to compensate for the following:
 - design tolerances of the facility, the building and the transformer
 - one-off movements caused by differences in the settling of the transformer and facility foundations
 - thermal expansion of component enclosures.

IEEE/PES Substation Committee- GIS Subcommittee

Gas Insulated Bus / Walkways, Ladders and Platforms

Gas Insulated Bus

- Expansion joints between individual bays
- **Proper grounding across flange and expansion joint connections**

Walkways, Ladders and Platforms

- Provide detailed drawings for platforms, stairs, walkways and ladders for safe, efficient access to all viewports, actuator mechanisms, switch operators, gas density monitoring equipment, etc., for maintenance and operations personnel

IEEE/PES Substation Committee- GIS Subcommittee

Local Control (LCC) (Marshalling) Cabinets and Secondary Equipment

- **One local LCC for each circuit breaker bay**
- Marshaling cabinets may also be required as intermediate termination locations between the GIS and LCC and LCC and the substation control room
- **Rear access door all external cabling terminated in the rear of the cabinet**
- Protection/Control and Monitoring Requirements
- Logic Diagrams for Numerical Relays
- SCADA Interface Points
- Wiring Connections and Interconnections Requirements
- Annunciation and Alarms
- AC Station Service
- Mimic Bus Diagram

Interfaces

- GIS – Air
- GIS – Cable
- GIS – Transformer
- GIS – GIS

GIS Interfaces

- GIS Interfaces are used to connect the GIS to other components in the substation and the connecting network. The following interfaces are available:
 - GIS to air by bushings
 - GIS to cable
 - GIS to transformer
 - Connecting new GIS to existing GIS

Standards concerning GIS Interfaces

IEEE C37.017 GIS Bushing to air

IEC 62271-209 Direct connection of GIS to fluid filled or dry type cables

IEC 62271-211 Direct connection of GIS to transformers

IEEE C37.122.6 Interface of existing GIS to new GIS

CIGRE TB 605 Recommendations for plug-in, dry type cable connection to GIS

GIS Evolution & Future Development

- GIS – Further Seize Reduction
- GIS – Low Power Instrument Transformers
- GIS – Alternative Insulating Gases

IEEE/PES Substation Committee- GIS Subcommittee

GIS Size Reduction Progress of GIS Development (145 kV)

IEEE/PES Substation Committee- GIS Subcommittee

GIS size reduction over a 47 year period

Amount of SF₆ has been reduced by about 70%

Conventional and Low-Power Instrument Transformers for High Voltage GIS

Conventional Technology

Conv. inductive **CT**
Current Transformer

Conv. inductive **VT**
Voltage Transformer

Low-Power Instrument Transformer (**LPIT**) Technology

GIS integrated sensors

Rogowski Coil
(current measurement)

**Electric Field Probe,
Capacitive Electric
Voltage sensor**
(voltage measurement)

Low-Power Instrument Transformer (LPIT) Technology reduces dimensions and weight of the GIS

Conventional (inductive) Measurement Technology

Reduces:
~ 90% of instrument transformer weight
~ 15% of GIS height

SF₆ amount

Low-Power Measurement Technology

Alternative gases to SF₆ Status today

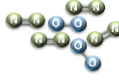

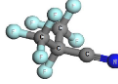

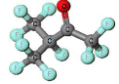

SF₆ has excellent electrical characteristics
→ Potent greenhouse gas with a high GWP

There are no restrictions so far on the application of SF₆ in HV
→ Included on the list of the fluorinated substances in the Kyoto protocol and the EU-F-Gas-regulation 517/2014

Responsible gas-handling only with state-of-the-art equipment
→ Less preventive actions of gas handling preferable

Characteristics of different gases for GIS

		 Sulfur-hexafluoride	 Clean-Air	 Fluoronitrile	 C5-Fluoroketone
Pure Gas	Chem. formula	SF ₆	N ₂ + O ₂ (80% / 20%)	(CF ₃) ₂ CFCN	(CF ₃) ₂ CFC(O)CF ₃
	CO ₂ -equivalent (GWP)	22.800	0	2.210	1
	Boiling point	-64°C	< -183°C	-5°C	+27°C
	Dielectrical strength	1*	0.43	2.2	1.7
Gas mixture	Background gas(es)	pure or in combination with N ₂ , CF ₄	N ₂ + O ₂ (80% / 20%)	~ 90% CO ₂	~ 90% O ₂ with N ₂ or CO ₂
	CO ₂ -equivalent (GWP)	< 22.800	0	~ 380	<1
	Lowest operation temp.	- 30°C	- 30°C	~ - 25°C	0°C to +5°C
Reaction during internal arc	Decomposition products	Hydrogen fluoride, sulfur dioxide, sulfur compounds	If applicable: Ozone and nitric oxide	Amongst others: carbon monoxide, carbon dioxide, hydrogen fluoride	
	Toxicity of decomposition products	Hazardous when inhaled, causes skin, and eye irritation ¹⁾	No decomposition products	Hazardous when inhaled, causes skin and eye irritation	

¹⁾ All Safety measures are defined and implemented
* Relative dielectric strength, standardization on SF₆

Different gases - different gas handling procedures

From

GIS Service Car

One Gas Monitoring

to

GIS Service Fleet

Multiple Gas Monitoring

Further steps to establish alternatives to SF₆

Users and manufactures need to be aligned on a SF₆ alternative solution considering also gas handling procedures

Further elaborations on technical parameters within working groups such as

GIS Next Step

- GIS – Clean Air Insulated
- GIS – Vacuum Switch Technology

IEEE/PES Substation Committee- GIS Subcommittee

SF₆ Alternatives – Key Advantages Vacuum Switching

- ✓ Short circuit breaking performance equivalent to SF₆
- ✓ High mechanical (M2) endurance (less drive energy required)
- ✓ Enhanced electrical endurance because of lower contact wear
 - > arc voltage & arcing times of Vacuum Circuit Breaker (VCB) are significantly lower
 - > number of possible VCB switching operations is significantly higher

Vacuum interrupter – Development of product / production technology

<p>1971 First serial manufacturing of vacuum interrupters for contactors.</p>	<ul style="list-style-type: none"> • More than 40 years of operational experience in the field of medium voltage applications • More than 5.5 million vacuum interrupters delivered only from Siemens 	<p>2010 Introduction of prototypes for 72.5 kV</p>	<p>2016 Introduction of 145 kV portfolio with vacuum interrupter for up to 72.5 kV and up to 145 kV</p>
--	---	---	--

IEEE/PES Substation Committee- GIS Subcommittee

Vacuum interrupter technology – Operational and environmental value

For more than 40 years successful operational experience in medium-voltage,
since 2010 in high-voltage

- High reliability**
 due to the hermetically tight vacuum interrupter,
 eliminating any influence of decomposition products
- High performance**
 Perfect for frequent switching applications: Excellent interrupting performance at rated nominal current and rated short-circuit currents throughout life-time of the vacuum circuit-breaker, up to 30 short-circuit interruptions
- Perfect for low temperature**
 No liquefaction of switching medium
- No maintenance**
 Maintenance free due to sealed for life technology; no spare part costs
- No CO₂e emissions**
 Switching media (vacuum) with GWP=0;
 no CO₂e emissions during operation, maintenance or recycling

IEEE/PES Substation Committee- GIS Subcommittee

GIS up to 72.5 kV / 25 kA

Technical data

Switchgear type	BVM1	
Rated voltage	up to	72.5 kV
Rated frequency		50 Hz
Rated short-duration power-frequency withstand voltage (1 min)	up to	140 kV
Rated lightning impulse withstand voltage (1.2 / 50 µs)	up to	325 kV
Rated normal current	up to	1250 A
Rated short-circuit breaking current	up to	25 kA
Rated peak withstand current	up to	68 kA
Rated short-time withstand current (up to 1 s)	up to	25 kA
Leakage rate per year and gas compartment (type-tested)		< 0.1 %
Driving mechanism of circuit-breaker		stored-energy spring
Rated operating sequence		0-0.3 s-CO-3 min-CO
Interrupter technology		CO-15 s-CO
Insulation medium		Vacuum
Weight of SF ₆ or other fluorinated greenhouse gases		Clean air
GWP Global Warming Potential		0 kg
CO ₂ equivalent		0
Rated filling pressure		0.56 MPa abs
Bay width common pole drive		1050 mm
Bay height, depth (depending on bay arrangement)		2330 mm x 2000 mm
Bay weight (depending on bay arrangement)		1.0 t
Ambient temperature range		-30 °C up to +45 °C
Installation		indoor
First major inspection		> 25 years
Expected lifetime		> 50 years
Standards		IEC
Other values on request		

Blue GIS 145 kV /- Example with Low-Power Instrument Transformer

- 1 Integrated local control cubicle
- 2 Circuit-breaker with vacuum interrupter
- 3 Spring-stored-energy operating mechanism with circuit-breaker control unit (common drive)
- 4 Busbar I with disconnector and earthing switch
- 5 Busbar II with disconnector and earthing switch
- 6 Low-Power Instrument Transformers (LPIT)
- 7 Outgoing module with disconnector and earthing switch
- 8 Make-proof earthing switch (high speed)
- 9 Cable sealing end

The design is modular using SF6 platform components ensuring all substation grid configurations. The gas pressure amount to 6.9 bar, which is only slightly higher than that of SF6 145 kV GIS.

Next steps of Blue Products and Vacuum Switching Technology

- ✓ Vacuum switching technology up to 420/550 kV, nominal currents 4000 A, short circuit currents 63 kA for 50/60 Hz in foreseeable future:
- ✓ First successful high-power & dielectric tests on single-break prototype VI for next SF6-free products for 245 kV & higher as series connection of VIs

VI 170 kV / 50 kA and 245 kV / 63 kA

170 kV VCB: Diffuse AMF vacuum arc at 20 kA peak

- B** **Design Features**
- C** **Development and Manufacturing**
- D** **Typical GIL Layout**
- E** **Installation and Commissioning**
- F** **Monitoring**

IEEE/PES Substation Committee- GIS Subcommittee

Introduction to GIL

Length 17 km – PP9 Saudia Arabia
Longest 420 kV GIL installed in the world

System Length 1 km - Palexpo, Switzerland
Underground Part of a GIL/Overhead Line

Xiluodu, Sichuan, China

Jinping, China

IEEE/PES Substation Committee- GIS Subcommittee

Technical Data GIL

Rated voltage	245 kV ... 550 kV
Impulse voltage	... 1.675 kV
Rated current	2.000 ... 5.000 A
Rated short time current	62 kA / 3 s
Rated Power	up to 4.700 MVA
Capacitance per length	55 nF/km
Overload capability	100 %
Insulating gas	0-80 % N ₂ / 100-20 % SF ₆

Application of N₂/SF₆ Gasmixture GIL in a Tunnel

PALEXPO, Swiss

Commisioned: 2001

The GIL is laid in a tunnel of 500m lenght using 700 m bending radius. It is part of overhead line at the airport of Geneva.

U_r	300 kV
I_r	2000 A
U_{BIL}	850 kV
I_s	50 ka

Applications of Direct Buried GIL

Joshua Falls

installed in 1978
Length 1640m

U_r	145 kV
I_r	2000 A
U_{BIL}	650 kV
I_s	63 kA/3 s

To minimize the overall visual impact of a new station, GIS was chosen for the switchgear and two GIL line exits were direct buried to overhead line access points away from the main GIS equipment.

IEEE/PES Substation Committee- GIS Subcommittee

Application of GIL Above Ground

PP9 1200 MW Combined Cycle Plant in Saudi Arabia, near Riyadh

total length of about 17 km

U_r	420 kV
I_r	1200 A at 55 °C
U_{BIL}	1425 kV
U_{PF}	630 kV
I_s	63 kA

IEEE/PES Substation Committee- GIS Subcommittee

Applications of GIL in Hydropower Station

Huanghe Laxiwa

U_r	800 kV
I_r	4000 A
U_{BIL}	2100 kV
U_{SIL}	1550 kV
I_s	63 kA

IEEE/PES Substation Committee- GIS Subcommittee

Application of GIL in a Hydro Dam

Xiluodu GIL
In operation since 2013

Rated Voltage	550 kV	Rated Current	4500 A
Rated Impulse- withstand Voltage	1675 kV	Rated Short-Time- withstand Current	63 kA, 3 s
Single phase length	app. 12.750m;		480m vertical shaft in each circuit

IEEE/PES Substation Committee- GIS Subcommittee

Application of GIL in a double Tunnel

Langwied, Munich

In operation since
2013

U_r	420 kV
I_r	3150 A
U_{BIL}	1425 kV
U_r	420 kV

View into the tunnel from the connection shaft the overhead line.

View into the tunnel with 400 m bending radius of GIL.

Transition section GIL to overhead line.

IEEE/PES Substation Committee- GIS Subcommittee

Application of GIL Direct Buried with Gasmixture

420 kV Kelsterbach Transmission Line

Customer:	Amprion GmbH 
Location:	Airport Frankfurt am Main
Type:	Buried Installation
Single phase length:	5.400 m
Date of operation:	2011
max. Power Rating:	2 x 2000 MVA
Operational power:	2 x 1800 MVA
Rated voltage:	420 kV
Rated current:	2750 A
Short time current:	63 kA, 1s
Rated impulse withstand voltage:	1425 kV
Key buying factor:	Buried installation technology, small trench width, transmission capacity
Challenges:	World's first buried GIL using N2/SF6 and on-site assembly process

Hermann Koch IEEE Fellow

Dr. Koch's first professional association was with research on particle discharge measurement methods for non-destructive testing at Technical University Darmstadt, Germany which he concluded with his Ph.D. degree in 1990. In 1991 he joined Siemens Germany, as high voltage switchgear engineer for gas-insulated substations (GIS). In 1994 he became the responsibility to design and develop the gas-insulated transmission technology (GIL) at Siemens. In 2001 he was responsible for the installation of the world wide first GIL with N_2/SF_6 gas-mixture at PALEXPO in Geneva, Swiss. Since 2001 Dr. Koch has managed several GIL project installations worldwide and is now engaged in developing the next step of this transmission technology for DC voltages. In 2010 Dr. Koch received his IEEE Fellow in this technical field.

Dr. Koch is active in international standardization since 1992 in IEC as SC 17C Secretary, in IEEE various chairmen in K0 GIS Subcommittee, Substations chairman and member of the IEEE-SA Board, in CIGRE member of B3 Substations and in Germany DKE related national committees.

Dr. Koch has contributed with more than 30 patents and over 130 publications in the technical field of gas-insulated technology. He has published IEEE books on GIL, GIS and soon on International Standardization published by www.wiely.com

Dr. Koch's research has opened new technical solutions for the applications worldwide of long distance bulk power underground transmission.
