# Introduction

- In earlier classes, you have studied linear equations in one variable. Example of a linear equation in one variable is  $2x+5=0$ . You know that such equations have a unique (i.e. one and only one) solution. You may also remember how to represent the solution of a linear equation in one variable on an number line.
- In this chapter, the knowledge of linear equations in one variable shall be recalled and extended to that of two variables.
- You will learn about the solution of linear equations in two variables.
- Further, you will learn about the geometric representation of linear equations in two variables.
- Further, you will learn about the equations of lines parallel to x-axis and y-axis.

# Linear Equations

- **Linear equation** is an equation which makes a straight line when graphed.
- **Linear equation in two variables** means a linear equation which consists of two different variables. For example,  $2x+3y=0$  is a linear equation in two variables.
- **While solving an equation**, you must always keep the following points in mind:  
The solution of a linear equation is not affected when:
  - the same number is added to (or subtracted from) both sides of the equation.
  - you multiply or divide both the sides of the equation by the same non-zero number.
- **The standard form of a linear equation in two variables** is of the form  $ax+by+c=0$ , where  $a$ ,  $b$  and  $c$  are real numbers, and  $a$  and  $b$  are not both zero, is called a linear equation in two variables. For example,  $7x+6y+5=0$  is of the form  $ax+by+c=0$  where  $a=7$ ,  $b=6$  and  $c=5$ .
- Equations of the type  $ax+b=0$  are also examples of linear equations in two variables because they can be expressed as  $ax+0.y+b=0$ . For example,  $4x-3=0$  can be written as  $4x+0.y-3=0$

# Solution of a Linear Equation

- A linear equation in two variables has **infinitely many solutions**.
- Let us try to find the solutions of the equation  $x+2y=6$ .

One of the way to find two solutions of an equation is put value of  $x$  as zero and then put value of  $y$  as zero.

If we put  $x=0$ , then the equation becomes  $0+2y=6$ , or  $y=3$ . Thus,  $x=0$  and  $y=3$  is a solution of the given equation.

Similarly, if we put  $y=0$ , then the equation becomes  $x+2(0)=6$ , or  $x+0=6$ , or  $x=6$ . Thus,  $x=6$  and  $y=0$  is another solution of the given equation.

Now, we can find even more solutions of the given equation, by taking the value of  $x$  as 1, 2, 3 etc.

So, we list down the solutions of the equation  $x+2y=6$  in the following table:

|     |   |   |     |   |     |
|-----|---|---|-----|---|-----|
| $x$ | 0 | 6 | 1   | 2 | 3   |
| $y$ | 3 | 0 | 2.5 | 2 | 1.5 |

# Graph of a Linear Equation in Two Variables

- **Graph of a linear equation** in two variables is the geometric representation of the solutions of the linear equation in two variables.
- **Graph of linear equation in two variables** can be drawn by plotting the solutions of the linear equation on a graph paper and joining those points to form a line.
- For example, let us draw the graph of the equation  $x+2y=6$ .

The solutions of the above equation can be obtained by assuming some values of  $x$  and finding corresponding values of  $y$  for each value of  $x$ . Some solutions can be expressed in the form of a table as given below:

|          |   |   |   |   |     |
|----------|---|---|---|---|-----|
| <b>x</b> | 0 | 6 | 2 | 4 | ... |
| <b>y</b> | 3 | 0 | 2 | 1 | ... |

# Graph of a Linear Equation in Two Variables (Contd..)

- Let us plot the points  $(0,3)$ ,  $(6,0)$ ,  $(2,2)$  and  $(4,1)$  on a graph paper. Now, join any two of these points and obtain a line. Let us call this line as AB (see Fig. 1.1).
- Note that:
  - Every point whose coordinates satisfy the given equation lies on the line AB.
  - Every point  $(a, b)$  on the line AB gives a solution  $x=a$ ,  $y=b$  of the given equation.
  - Any point, which does not lie on the line AB, is not a solution of the given equation.

Fig. 1.1

# Equations of Lines Parallel to the x-axis and y-axis

- The graph of the linear equation  $x=a$  is a straight line parallel to y-axis.
- Let us take an example. Consider the equation  $x=2$ . Now, this equation can be expressed as  $x+0.y=2$ . This has infinitely many solutions. Some of the solutions of this equation are listed in the below table:

|   |   |   |   |   |     |
|---|---|---|---|---|-----|
| x | 2 | 2 | 2 | 2 | ... |
| y | 0 | 1 | 2 | 3 | ... |

Now, let us plot the solutions of this equation on a graph paper (see Fig. 1.2). We observe that the graph of the equation  $x=2$  is a straight line parallel to y-axis.

Fig. 1.2

# Equations of Lines Parallel to the x-axis and y-axis (Contd..)

- The graph of the linear equation  $y=a$  is a straight line parallel to x-axis.
- Let us take an example. Consider the equation  $y=3$ . Now, this equation can be expressed as  $0.x+y=3$ . This has infinitely many solutions. Some of the solutions of this equation are listed in the below table:

|   |   |   |   |   |     |
|---|---|---|---|---|-----|
| x | 0 | 1 | 2 | 3 | ... |
| y | 3 | 3 | 3 | 3 | ... |

Now, let us plot the solutions of this equation on a graph paper (see Fig. 1.3). We observe that the graph of the equation  $y=3$  is a straight line parallel to x-axis.

Fig. 1.3

# Summary

- An equation of the form  $ax+by+c=0$ , where  $a$ ,  $b$  and  $c$  are real numbers, such that  $a$  and  $b$  are not both zero, is called a linear equation in two variables.
- A linear equation in two variables has infinitely many solutions.
- The graph of every linear equation in two variables is a straight line.
- $x=0$  is the equation of the  $y$ -axis and  $y=0$  is the equation of the  $x$ -axis.
- The graph of  $x=a$  is a straight line parallel to the  $y$ -axis.
- The graph of  $y=a$  is a straight line parallel to the  $x$ -axis.
- An equation of the type  $y=mx$  represents a line passing through the origin.
- Every point on the graph of a linear equation in two variables is a solution of the linear equation. Moreover, every solution of the linear equation is a point on the graph of the linear equation.

THANK YOU
