

```
/*
* PROBLEM STATEMENT: Write a program to accept a sentence which may be terminated by either . Or ? only.
* The words are to be separated by a single blank space.
* Print an error message if the input does not terminate with . Or ? only.
* You can assume that no word in the sentence exceeds 15 characters, so that you get a proper formatted output.
* Perform the following tasks:
* (i) Convert the first letter of each word to uppercase.
* (ii) Find the number of vowels and consonants in each word and display them with proper headings along with the words.
* AUTHOR: Soumyajit Pal
* LOGIC: Checking for validity of the sentence involves verifying the (N-1)th index of the string, where N is the length of the string.
* Extracting each word from the sentence by checking for spaces in between is the crux of the solution. Each word can then be manipulated as desired.
