

Risk Management in Stock Market is not an option but mandatory

Your success or failure depends on how you manage your risk while trading in stock market.

Fundamental Analysis of stock market does not offer proper risk management procedure while trading/investing. There is no such concept of stop loss in fundamental analysis like technical analysis. Technical traders enjoy the stop loss facility while trading. It is also true that there is no such indicator or combination

of indicators or strategies guarantees the success too but in technical trading we can manage our risk according to our risk appetite and that is the main advantage. We also can predict the near term future price movement of stocks, on the basis of historical price movement, to some extent with the help of technical analysis.

We should also remember that some trading system works nicely with bullish market some with bearish but maximum fails when the market or stock goes sideways or choppy, or can say that no trading system works nicely with all types of market and moreover there are thousands & lakhs of technical indicators or trading system available in the market, choosing one of them which fits to your trading time frame, style, risk appetite is very a big issue.

In short, technical trading requires vast knowledge and experience too.

In today's first life, you need something easy to use, easy to understand, easy to learn (only 2-10 hrs of learning) & pocket friendly too.
