CONSUMER'S (EQUILLIBRIUM)
A consumer is one who buys goods and services for satisfaction of wants.
Why are we studying this chapter?
As the resources are limited in relation to unlimited wants, a consumer has to follow some principles or laws in order to attain the highest level of satisfaction. To study about this highest level of satisfaction we are going to study this chapter.
Two main approaches to study consumer behaviour and consumer equilibrium are:-
<ol> <li>Cardinal Utility approach (Marshall's Utility Analysis or Marginal Utility analysis)</li> <li>Ordinal Utility approach (Indifference Curve Analysis or Hicksian Analysis)</li> </ol>
Nimerical and a second se
CARDINAL UTILITY APPROACH
Under the cardinal utility approach, the concept of ' <b>UTILITY</b> ' is used to attain the consumer's equilibrium.
Utility:- It refers to want satisfying power of a commodity. Utility differs from person to person, place to place and time to time.
How to Calculate Utility?
By using Cardinal Utility approach, it is possible to numerically estimate Utility, which a person derives from consumption of goods and services. But, there is no standard unit to measure utility. Therefore, economists derived an imaginary measure known as <b>UTILS</b> .
UTILS are imaginary units which are used to measure satisfaction obtained from
consumption of a certain quantity of a commodity.

*A lawsof Diminishing Marginal () Hility	· · · ·				
Law of diminishing marginal utility(DMU) states that as	s we con	sume mor	e and mo	ore	
units of a commodity, the utility derived from each suc	cessive	unit goes	on decre	asing.	
<ul> <li>Law of DMU is a UNIVERSAL law and it applies to</li> <li>Law of DMU was given by Proff. H H COSSEN</li> </ul>	all the g	oods and	services.		
<ul> <li>Its another name is Gossen's First law of consumption</li> </ul>	otion.			• • •	
	• • •				
	• • •		• • •	• • •	
			• • •	• • •	
		• • •	• • •	• • •	

Assumptions of Law of DMU:-
<b>1. Consumption of reasonable quantity:-</b> It is assumed that a reasonable quantity of the commodity is consumed.
<b>2. Continuous Consumption:-</b> It is assumed that consumption is a continuous process.
<b>3. No change in quality:-</b> Quality of the commodity consumed is assumed to be constant.
<b>4. Fixed income and prices:-</b> It is assumed that income of the consumer and prices of the goods which the consumer wishes to purchase remain constant.
<ul> <li>5. Perfect Knowledge:- It is assumed that the consumer knows the different goods on which income can be spent and the utility that he is likely to get out of such consumption.</li> <li>Consumer Equillibrium (Cardinal Approach)</li> <li>It refers to the situation when a consumer is having maximum satisfaction with limited income and has no tendency to change his way of existing expenditure.</li> </ul>
As per the Law of DMU, utility derived from each successive unit goes on decreasing. At the same time, his income also decreases with purchase of more and more units. So, a rational consumer aims to balance his expenditure in such a manner, so that he gets maximum satisfaction with minimum expenditure.
Consumer equilibrium, car be discussed under two dimerent situations
I. Consumer spends his entire income on a Single Commodity
2, Consumer spends his entire income on Two Commodities

## Consumer spends his entire income on Single Commodity:-

A consumer purchasing a single commodity will be at equilibrium, when he is buying such a quantity of that commodity, which gives him maximum satisfaction.

MU in utils MU of one Rupec (MUm) MU in terms of Money Equillibrium Condition :when Marginal utility is equal to price paid four the commodity. x-sname of commodily (MUx = Px) is assumed that for simplicity, it ₹ 1 = 1 utils therefore MUm = 21 MU in utils MU of one Rupec (MUm) MU. in terms of Money what if  $[MU_x > P_x]$ If MUx is greater than Px, then consumer is not at equilibrium and he goes on buying because benefit is greater than the cost. As he buys more, MU falls because of Law of DMU. When MU becomes equal to price, consumer gets maximum benefit and he is in equilibrium. what is MUX < Px In this case also consumer is not at equilibrium, as he will have to reduce consumption of commodity to raise his total satisfaction till MU becomes equal to price.

So, it can be concluded that a consumer who is consuming a single commodity, will be at equilibrium when MU from commodity is equal to Price paid for the commodity.

## ORDINAL UTILITY APPROACH(INDIFFERENCE CURVE ANALYSIS)

**Indifference curve** refers to the graphical representation of various alternative combination of bundles of two goods among which the consumer is indifferent.

J	indifference sc	hedule		
combination of Apples & Bananas	Apples (A	· · · · · · ·	Bananc	24 (B)

· · · · · · · · · · · · · · · · · · ·			456 Apples	<u> </u>

Ques.	Why does increase in consumption of one good requires decrease in
consur	nption of other good for indifference curve analysis?

<b>Sol.</b> It happens because if consumption of one good(Apple) is increased, while that of other good(Bananas) is not decreased and vice versa, then in such a combination, consumer will have more quantity of 1 good which means more satisfaction as compared to other combinations, which is against the basic assumption of indifference schedule that each combination should have same satisfaction.
. //
<b>MONOTONIC PREFERENCE:-</b> It means that a rational consumer always prefers more of a commodity as it offers him a higher level of satisfaction.
For example:- A) Two given combination (10A, 10B) & (7A, 7B) Consumer will prefer combination 1 as it contains more of both apple and bananas.
B) Two given combination (10A, 7B) & (9A, 7B)
Consumer will prefer combination 1 as it contains more of both apple and equal amount of bananas.
These decisions are made because of monotonic preference.
<b>Indifference Map:-</b> It refers to the family of indifference curves that represent consumer preferences over all the bundles of the two goods.
Higher indifference curve represents higher level of satisfaction as higher IC represents larger bundle of goods, which means more utility because of $IC_3$ monotonic preference.
Each IC shows different level of satisfaction.
$IC_1 < IC_2 < IC_3 < IC_4$

Properties of Indifference Curve:-
<b>1. Indifference curves are always convex to the origin:-</b> An indifference curve is convex to the origin because of diminishing MRS. MRS declines continuously because of law of DMU.
<b>2. Indifference curve slope downwards:-</b> It implies that as a consumer consumes more of one good, he must consume less of the other good. It happens because if the consumer decided <b>a</b> to have more un its of one good, he will have to reduce the units of other good, so that Total satisfaction remains same.
<b>3. Higher indifference curve represents higher level of satisfaction:-</b> Higher indifference curve represents large bundle of goods, which means more utility because of monotonic preferences.
4. Indifference curve can never intersect each other:- Two indifference curves can never intersect each other because they cannot represent same level of satisfaction.
What is MARGINAL RATE OF SUBSTITUTION?
that total satisfaction of the consumer remains the same.
• MRS measures the slope of Indifference Curve.
+1 -3
'An Indifference curve can never touch X-axis or Y-axis'. Why?
<b>Sol:-</b> If IC touches Y- axis, it would mean that consumption of commodity on X- axis is zero.
If IC touches X-axis, it would mean that consumption of commodity on Y-axis is zero.
Therefore, an IC can never touch any of the AXES. $10 \text{ cm}$

It is a graphical representation of all possible combinations of two goods which can be purchased with given income and prices, such that the cost of each of these combinations is equal to the money income of the consumer.
